Gorban, Dirk Roose, 2010-10-21 This volume contains the extended version of selected talks given at the international research workshop Coping with Complexity Model Reduction and Data Analysis Ambleside UK August 31 September 4 2009 The book is deliberately broad in scope and aims at promoting new ideas and methodological perspectives The topics of the chapters range from theoretical analysis of complex and multiscale mathematical models to applications in e g fluid dynamics and chemical kinetics

Proceedings of the Conference on Applied Mathematics and Scientific Computing Zlatko Drmac, Miljenko Marusic, Zvonimir Tutek, 2005-12-05 This book brings together contributed papers presenting new results covering different areas of applied mathematics and scientific computing Firstly four invited lectures give state of the art presentations in the fields of numerical linear algebra shape preserving approximation and singular perturbation theory Then an overview of numerical solutions to skew Hamiltonian and Hamiltonian eigenvalue problems in system and control theory is given by Benner Kressner and Mehrmann The important issue of structure preserving algorithms and structured condition numbers is discussed Costantini and Sampoli review the basic ideas of the abstract schemes and show that they can be used to solve any problem concerning the construction of spline curves subject to local constraints Kvasov presents a novel approach in solving the problem of shape preserving spline interpolation Formulating this problem as a differential multipoint boundary value problem for hyperbolic and biharmonic tension splines he considers its finite difference approximation Miller and Shishkin consider the Black Scholes equation that for some values of the parameters may be a singularly perturbed problem They construct a new numerical method on an appropriately fitted piecewise uniform mesh which is parameter uniformly convergent

Multiscale Modeling and Simulation in Science Björn Engquist, Per Lötstedt, Olof Runborg, 2009-02-11 Most problems in science involve many scales in time and space An example is turbulent flow where the important large scale quantities of lift and drag of a wing depend on the behavior of the small vortices in the boundary layer Another example is chemical reactions with concentrations of the species varying over seconds and hours while the time scale of the oscillations of the chemical bonds is of the order of femtoseconds A third example from structural mechanics is the stress and strain in a solid beam which is well described by macroscopic equations but at the tip of a crack

modeling details on a microscale are needed. A common difficulty with the simulation of these problems and many others in physics, chemistry, and biology is that an attempt to represent all scales will lead to an enormous computational problem with unacceptably long computation times and large memory requirements. On the other hand, if the discretization at a coarse level ignores the mesoscale information, then the solution will not be physically meaningful. The influence of the mesoscales must be incorporated into the model. This volume is the result of a Summer School on Multiscale Modeling and Simulation in Science held at Bosön Lidingö outside Stockholm, Sweden, in June 2007. Sixty PhD students from applied mathematics, the sciences, and engineering participated in the summer school.

Matrix Analysis and Computations Zhong-Zhi Bai, Jian-Yu Pan, 2021-09-09. This comprehensive book is presented in two parts: the first part introduces the basics of matrix analysis necessary for matrix computations, and the second part presents representative methods and the corresponding theories in matrix computations. Among the key features of the book are the extensive exercises at the end of each chapter. *Matrix Analysis and Computations* provides readers with the matrix theory necessary for matrix computations, especially for direct and iterative methods for solving systems of linear equations. It includes systematic methods and rigorous theory on matrix splitting, iteration methods, and Krylov subspace iteration methods, as well as current results on preconditioning and iterative methods for solving standard and generalized saddle point linear systems. This book can be used as a textbook for graduate students as well as a self-study tool and reference for researchers and engineers interested in matrix analysis and matrix computations. It is appropriate for courses in numerical analysis, numerical optimization, data science, and approximation theory, among other topics.

Matrix Computations Gene Howard Golub, Charles F. Van Loan, 2013-02-15. The Finite Element Method: Theory, Implementation, and Applications

Mats G. Larson, Fredrik Bengzon, 2013-01-13 This book gives an introduction to the finite element method as a general computational method for solving partial differential equations approximately Our approach is mathematical in nature with a strong focus on the underlying mathematical principles such as approximation properties of piecewise polynomial spaces and variational formulations of partial differential equations but with a minimum level of advanced mathematical machinery from functional analysis and partial differential equations In principle the material should be accessible to students with only knowledge of calculus of several variables basic partial differential equations and linear algebra as the necessary concepts from more

advanced analysis are introduced when needed Throughout the text we emphasize implementation of the involved algorithms and have therefore mixed mathematical theory with concrete computer code using the numerical software MATLAB is and its PDE Toolbox We have also had the ambition to cover some of the most important applications of finite elements and the basic finite element methods developed for those applications including diffusion and transport phenomena solid and fluid mechanics and also electromagnetics
