A Study of Business Decisions Under Uncertainty Andreas Stark,2010-07 This dissertation will discuss the uncertainty encountered in the daily operations of businesses The concepts will be developed by first giving an overview of probability and statistics as used in our everyday activities such as the basic principles of probability univariate and multivariate statistics data clustering and mapping as well as time sequence and spectral analysis

The examples used will be from the oil and gas exploration industry because the risks taken in this industry are normally quite large and are ideal for showing the application of the various techniques for minimizing risk. Subsequently the discussion will deal with basic risk analysis, spatial and time variations of risk, geotechnical risk analysis, risk aversion and how it is affected by personal biases and how to use portfolios to hedge risk together with the application of real options. Next fractal analysis and its application to economics and risk analysis will be examined followed by some examples showing the change in the Value at Risk under Fractal Brownian Motions. Finally a neural network application is shown whereby some of these risks and risk factors will be combined to forecast the best possible outcome given a certain knowledge base. The chapters will discuss Basic probability techniques and uncertainty principles, Analysis and diversification for exploration projects, The value and risk of information in the decision process, Simulation techniques and modeling of uncertainty, Project valuation and project risk return, Modeling risk propensity or preference, analysis of exploration projects, Application of fractals to risk analysis, Simultaneous prediction of strategic risk and decision attributes using multivariate statistics and neural networks.

Solving Differential Equations in R Karlne Soetaert, Jeff Cash, Francesca Mazzia, 2012-06-06. Mathematics plays an important role in many scientific and engineering disciplines. This book deals with the numerical solution of differential equations, a very important branch of mathematics. Our aim is to give a practical and theoretical account of how to solve a large variety of differential equations comprising ordinary differential equations, initial value problems and boundary value problems, differential algebraic equations, partial differential equations and delay differential equations. The solution of differential equations using R is the main focus of this book. It is therefore intended for the practitioner, the student and the scientist who wants to know how to use R for solving differential equations. However, it has been our goal that non-mathematicians should at least understand the basics of the methods while obtaining entrance into the relevant literature that provides more mathematical background. Therefore each chapter that deals with R examples is preceded by a chapter where the theory behind the numerical methods being used is introduced. In the sections that deal with the use of R for solving differential equations, we have taken examples from a variety of disciplines including biology, chemistry, physics, pharmacokinetics. Many examples are well known test examples used frequently in the field of numerical analysis.
