Bibliography of Low Energy Electron Collision Cross Section Data Lee Joseph Kieffer, 1967 A bibliography of low energy electron collision cross section data is presented Only references which report original measurements or calculations of electron collision cross sections are included The cross section data for each process are listed by atomic species in order of their atomic number The data for molecules are listed in arbitrary order Author Analysis of Excitation and Ionization of Atoms and Molecules by Electron Impact Afzal Chaudhry, Hans Kleinpoppen, 2010-10-17 The content of this book describes in detail the results of the present measurements of the partial and total doubly differential cross sections for the multiple ionization of rare gas atoms by electron impact These measurements show beside other trends the role of Auger transitions

in the production of multiply ionized atoms in the region where the incident electron energy is sufficient to produce inner shell ionization. Other processes like Coster-Kronig transitions and shake off also contribute towards increasing the charge of the ions. The incident electron having energy of 6 keV for example in a collision with xenon atom can remove up to nine electrons. X-ray ion coincidence spectroscopy of the electron-xenon atom collisions is also described. The present measurements of doubly differential cross sections for the dissociative and non-dissociative ionization of hydrogen sulfide and sulfur hexafluoride molecular gases by electron impact are also described in the text of this book. The results of the measurements for sulfur dioxide molecule show how this major atmospheric pollutant can be removed from the atmosphere by electron impact dissociation of this molecule. The present results of the measurements for sulfur hexafluoride give an insight into the dissociation properties of this molecular gas which is being so widely used as a gaseous insulator in the electrical circuits. The book also describes the present measurements of the polarization parameters of the fluorescence radiation emitted by the electron impact excited atoms of sodium and potassium. In these investigations the target atoms are polarized; therefore the measurements of the polarization parameters give information about the electron-atom interaction in terms of the interference, direct and exchange interaction channels.
