

Polyester resins as a matrix material in advanced fibre-reinforced polymer (FRP) composites

N. MISKOLCZI, University of Pannonia, Hungary

DOI: 10.1533/9780857098041.1.44

Abstract: The chapter discusses the use of one type of thermoset polymer, polyester, and its use as a matrix material in fibre-reinforced polymer (FRP) composites. It begins with an overview of FRP composites, before explaining why polyester is a particularly suitable material for this application, through discussion of its key properties and structures and the manufacturing processes involved. Composites can offer improved mechanical properties compared with pure polymers at no extra cost, meaning that they are widely used in a variety of applications, including in the transport industry (manufacturing passenger cars and other vehicles), marine and shipping uses, and as structural materials. Some examples of these applications, particularly in civil engineering, are provided in this chapter, along with discussion of potential future trends in the field.

Key words: fibre-reinforced polymer composites, polyester, thermoset polymers, composites, reinforced polymers, construction materials, mechanical properties.

3.1 Introduction

The development of human civilization depends on the availability of different construction materials. Metals, ceramics, composites, polymers and other materials have all been used, or are expected to be used in the future, as structural materials. However, the relative importance of these construction materials has changed over time. Composites are structural materials produced through the combination of different constituents. They were first discovered and used in antiquity: the first artificial composite was adobe, made of vegetable parts (such as straw) and mud. Since then other types of construction material have grown in importance, including natural composites such as wood and concrete. The latter part of the twentieth century has been described as the age of polymers. The first synthetic polymers were discovered in the last decade of the nineteenth century but their bulk application began after the 1950s, after which they became increasingly important. The first polymer-based composites consisted of glass fibres and polyesters, which were used in radar technology in the 1940s [1–3].
