Health Care in the Next Curve John Abendshien,2018-08-06 Healthcare in the U S is a critical juncture We face a sharp upward rise in the number of people with chronic diseases and disabilities As demands on our current health system grow so will costs But as a society we are approaching the upper limit of how much we are willing or able to spend on health care Health care policy makers know this That is why major health reform measures are focused on population health and value based care These are the so called second curve objectives But these initiatives are doomed to failure We are asking a system to do things that it was not designed to do In fact we don t have a health care system as such We have a parts bin of disconnected silos Fragmented delivery systems Specialized caregivers Professional groups Trade associations All with distinct cultures Each with their own motivations and agendas Our payer and regulatory structures have evolved over the decades in response to political and policy initiatives However well intentioned or not these structures defy logic They reward and reinforce counter productive industry behaviors They pose formidable roadblocks to achieving needed changes Current reform initiatives are an implicit recognition that our health model is flawed The attitude seems to be Yes we know the overall health system is a problem but we can make failure less severe if we implement these measures We are at a critical juncture We can continue to place additional demands on an industry model that has outlived its functional utility Or we can take more of a clean slate approach and move toward a model that is in keeping with today s needs The outlook is not good if we stay on the current curve The demands on resources will continue their upward trajectory The default scenario will be one of rationing and less to invest in new cures and new technologies The good news is that we are within sight of a future state of health care that can really work In this future state we have gotten rid of the artificial barriers to effective and efficient patient care Physicians and other health professionals work in a coordinated inter disciplinary fashion They have accountability for the whole care cycle Caregivers have both the flexibility and encouragement to innovate and come up with optimal delivery approaches And because they are in a risk reward relationship with payers they have the incentives to provide true value Patients feel intimately connected to a system that is focused on their specific needs The key to this future state is good old fashioned market discipline Other delivery models must either improve or get out of the way The market will demand cost efficiencies and won t tolerate waste Much of our regulatory structure will be rendered unnecessary There will be not rewards for poor performance This book takes a unique macro level perspective of clinical economic and regulatory problems and possible solutions It takes an objective and something scathing look at current

industry structure a silo driven culture and entrenchment that is driven by self interest as well as the complicity of government in preserving the status quo through regulations licensure payment systems etc

Rutter,2018-10-03 Interest in the study of geometry is currently enjoying a resurgence understandably so as the study of curves was once the playground of some very great mathematicians However many of the subject s more exciting aspects require a somewhat advanced mathematics background For the fun stuff to be accessible we need to offer students an introduction with modest prerequisites one that stimulates their interest and focuses on problem solving Integrating parametric algebraic and projective curves into a single text *Geometry of Curves* offers students a unique approach that provides a mathematical structure for solving problems not just a catalog of theorems The author begins with the basics then takes students on a fascinating journey from conics higher algebraic and transcendental curves through the properties of parametric curves the classification of lima ons envelopes and finally to projective curves their relationship to algebraic curves and their application to asymptotes and boundedness The uniqueness of this treatment lies in its integration of the different types of curves its use of analytic methods and its generous number of examples exercises and illustrations The result is a practical text almost entirely self contained that not only imparts a deeper understanding of the theory but inspires a heightened appreciation of geometry and interest in more advanced studies *Introduction to Programming in Java*
