Twisted Isospectrality, Homological Wideness, and Isometry Gunther Cornelissen, Norbert Peyerimhoff, 2023-05-10 The question of reconstructing a geometric shape from spectra of operators such as the Laplace operator is decades old and an active area of research in mathematics and mathematical physics This book focusses on the case of compact Riemannian manifolds and in particular the question whether one can find finitely many natural operators that determine whether two such manifolds are isometric coverings The methods outlined in the book fit into the tradition of the famous work of Sunada on the construction of isospectral non isometric manifolds and thus do not focus on analytic techniques but rather on algebraic methods in particular the analogy with constructions in number theory methods from representation theory and from algebraic topology The main goal of the book is to present the construction of finitely many twisted Laplace operators whose spectrum determines covering equivalence of two Riemannian manifolds The book has a leisure pace and presents details and examples that are hard to find in the literature concerning fiber products of manifolds and orbifolds the distinction between the spectrum and the spectral zeta function for general operators strong isospectrality twisted Laplacians the action of isometry groups on homology groups monomial structures on group representations geometric and group theoretical realisation of coverings with wreath products as covering groups and class field theory for manifolds The book contains a wealth of worked examples and open problems After perusing the book the reader will have a

comfortable working knowledge of the algebraic approach to isospectrality This is an open access book **Constructive Commutative Algebra** Ihsen Yengui, 2015-12-11 The main goal of this book is to find the constructive content hidden in abstract proofs of concrete theorems in Commutative Algebra especially in well known theorems concerning projective modules over polynomial rings mainly the Quillen Suslin theorem and syzygies of multivariate polynomials with coefficients in a valuation ring Simple and constructive proofs of some results in the theory of projective modules over polynomial rings are also given and light is cast upon recent progress on the Hermite ring and Gröbner ring conjectures New conjectures on unimodular completion arising from our constructive approach to the unimodular completion problem are presented Constructive algebra can be understood as a first preprocessing step for computer algebra that leads to the discovery of general algorithms even if they are sometimes not efficient From a logical point of view the dynamical evaluation gives a constructive substitute for two highly nonconstructive tools of abstract algebra the Law of Excluded Middle and Zorn's Lemma For instance these tools are required in order to construct the complete prime factorization of an ideal in a Dedekind ring whereas the dynamical method reveals the computational content of this construction These lecture notes follow this dynamical philosophy Advances in Rings, Modules and Factorizations Alberto Facchini, Marco Fontana, Alfred Geroldinger, Bruce Olberding, 2020-06-02 Occasioned by the international conference Rings and Factorizations held in February 2018 at University of Graz Austria this volume represents a wide range of research trends in the theory of commutative and non commutative rings and their modules including multiplicative ideal theory Dedekind and Krull rings and their generalizations rings of integer valued polynomials topological aspects of ring theory factorization theory in rings and semigroups and direct sum decompositions of modules The volume will be of interest to researchers seeking to extend or utilize work in these areas as well as graduate students wishing to find entryways into active areas of current research in algebra A novel aspect of the volume is an emphasis on how diverse types of algebraic structures and contexts rings modules semigroups categories may be treated with overlapping and reinforcing approaches **Combinatorial and Additive Number Theory IV** Melvyn B. Nathanson, 2021-08-12 This is the fourth in a series of proceedings of the Combinatorial and Additive Number Theory CANT conferences based on talks from the 2019 and 2020 workshops at the City University of New York The latter was held online due to the COVID 19 pandemic and featured speakers from North and South America Europe and Asia The 2020 Zoom conference was the largest CANT conference in terms of the number of both lectures and participants These proceedings contain 25 peer reviewed and edited papers on current topics in number theory Held every year since 2003 at the CUNY Graduate Center the workshop surveys state of the art open problems in combinatorial and additive number theory and related parts of mathematics Topics featured in this volume include sumsets zero sum sequences minimal complements analytic and prime number theory Hausdorff dimension combinatorial and discrete geometry and Ramsey theory This selection of articles will be of relevance to both researchers and graduate students interested in current

progress in number theory **Ramanujan's Notebooks** Bruce C. Berndt, 2012-12-06 Srinivasa Ramanujan is arguably the greatest mathematician that India has produced His story is quite unusual although he had no formal education in mathematics he taught himself and managed to produce many important new results With the support of the English number theorist G H Hardy Ramanujan received a scholarship to go to England and study mathematics He died very young at the age of 32 leaving behind three notebooks containing almost 3000 theorems virtually all without proof G H Hardy and others strongly urged that notebooks be edited and published and the result is this series of books This volume deals with Chapters 1-9 of Book II each theorem is either proved or a reference to a proof is given Chain Conditions in Commutative Rings Ali Benhissi, 2022-10-07 This book gathers in a beautifully structured way recent findings on chain conditions in commutative algebra that were previously only available in papers The majority of chapters are self contained and all include detailed proofs a wealth of examples and solved exercises and a complete reference list The topics covered include S Noetherian S Artinian Nonnil Noetherian and Strongly Hopfian properties on commutative rings and their transfer to extensions such as polynomial and power series rings and more Though primarily intended for readers with a background in commutative rings modules polynomials and power series extension rings the book can also be used as a reference guide to support graduate level algebra courses or as a starting point for further research
