

EXPERIMENT No 06

To research the product recovery of solid powder produced by a spray drier from a liquid feed.

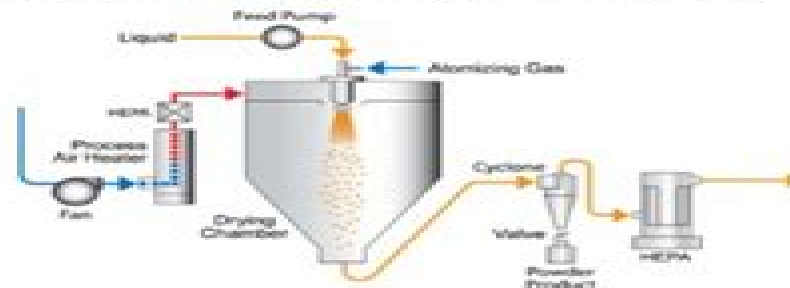

Objective:

The purpose of this experiment is to ascertain the spray dryer's yield and the effects of other factors on the recovery of solids from processing fluid, including,

- Compressor pressure
- Fluid flow rate
- Heater temperature
- Air flow rate

Theory:

By spraying the liquid feed into a hot drying medium, a material can be converted from a fluid condition to a dried powder form by the process of spray drying. One of the most affordable and economically viable drying methods is this one. To distribute liquid or slurry in a spray with controlled droplet size, all spray dryers employ a specific type of spray nozzle. This technique is only employed for liquid slurries.

Procedure:

- ✓ To prepare 10% milk solution, combine 50g of dry milk powder with 500ml of hot water.
- ✓ The heater was turned on when the solution was prepared, the desired temperature was chosen, and the green button was clicked to activate the blower for a certain air flow.
- ✓ Priming was finished by removing the air bubble with tap water.
- ✓ After the milk solution reached the desired temperature, the pump and compressor were turned ON, and the milk solution was poured beneath the peristaltic pump section head.
- ✓ Showering was made feasible by high pressure, a pump, and a specific fluid flow up to the atomizer.
- ✓ While taking a shower, the hot gas that is passed through the heater makes contact with the liquid there and starts to dry.
- ✓ Dried milk powder was transferred and deposited inside each cyclone in succession.
