Abstract: Melamine-formaldehyde (MF) resins are widely used as surface finishes for engineered wood-based panels in decorative laminates. Since no additional glue is applied in lamination, the overall residual curing capacity of MF resins is of great technological importance. Residual curing capacity is measured by differential scanning calorimetry (DSC) as the exothermic curing enthalpy is integral to the liquid resin. After resin synthesis is completed, the resulting pre-polymer has a defined chemical structure with a corresponding residual curing capacity. Predicting the residual curing capacity of a resin batch already at an early stage during synthesis would enable corrective measures to be taken by making adjustments in the reaction conditions. Thereby, discarding faulty batches could be avoided. Here, by using a batch modelling approach, it is demonstrated how quantitative predictions of MF residual curing capacity can be derived from inline Fourier Transform infrared (FTIR) spectra recorded during resin synthesis using partial least squares regression. Not only is there a strong correlation ($R^2 = 0.899$) between the infrared spectra measured at the end of MF resin synthesis and the residual curing capacity, but also the inline reaction spectra obtained already at the point of complete dissolution of melamine upon methylation during the initial stage of resin synthesis are also well suited for predicting final curing performance of the resin and a valid regression model ($R^2 = 0.85$) can be established using information obtained at a very early stage of MF resin synthesis.

1. Introduction

Melamine-formaldehyde (MF) resins have been widely used in the wood-processing industry as glues, binders and coatings for many decades due to their outstanding properties [1]. Exceptional resistance against hydrolysis and chemicals as well as remarkable mechanical properties such as high scratch and abrasion resistance make MF resins indispensable for most engineered wood products [2–5].

Since the 1950s, much research has been conducted to understand melamine-formaldehyde resins and to develop MF resins for special applications. The fundamentals are already well

Middelhoek, 1999-06-01 This authoritative new book focuses on recent developments in the instrumentation for sensing voltages and currents It covers new trends and challenges in the field such as measurements of biocurrents the increased speed of the components for data taking testing of computers and integrated circuits where the measurement of rapid voltage and current variations on a very small geometrical scale is necessary The first chapter concentrates on recent methods to sense voltages and currents while the rest of the book investigates the applied side covering for instance electrical power and energy measurements The main purpose of this volume is to illustrate commonly employed techniques rather than track the scientific evolution and merits and therefore mainly covers patent literature aimed at industrial applications It is an exciting addition justifying the series claim to cover state of the art developments in both the applied and theoretical fields of sensors and actuators The measurement of voltages and currents is a common task in the field of electricity and electronics From a technical point of view it is useful to identify schematically different steps of such a measurement In a first step a voltage or a current is sensed intermediate steps such as amplification transmission and further treatment may follow to yield the result in the final step Today in most cases microprocessors perform the final steps of such measurements Analog to digital converters digitise a voltage that is proportional to the value to be measured and a processor performs further computations and handles the storage and the display of the results The prerequisite for such measurements are sensors or transducers that respond in a known way to the voltage or current to be measured The emphasis of this book is put on recent developments of the instrumentation for sensing voltages and currents Aside from the general trend towards smaller cheaper and more reliable instrumentation new demands have arisen New applications like measurements of biocurrents ask for higher sensitivities Computers and integrated circuits pose new challenges To exploit the increased speed of the components for data taking suitable sensors are required The accuracy that can be achieved depends more than ever on the first step the acquisition of the raw data The influence of the measurement process on the results becomes more crucial Testing of integrated circuits themselves is a completely new application For such tests one has to measure rapid voltage and current variations on very small geometrical scales Here as well as in the traditional high voltage applications contactless measurements play an important role The organisation of this book is as follows In the first chapter different methods to sense voltages and currents are described For the sake of completeness most commonly used methods are mentioned we concentrate however on those developed recently The chapters address the subject from the side of different applications in which voltages and currents are sensed Since the main purpose of this publication is to illustrate commonly employed techniques rather than to track the scientific evolution and merits in particular fields in general those publications that illustrate a particular measurement principle best have been cited The
