This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics. It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by Soviet Encyclopaedia Publishing House in five volumes in 1977-1985. The annotated translation consists of ten volumes including a special index volume. There are three kinds of articles in this ENCYCLOPAEDIA. First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used. The main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible. On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science, engineers and teachers of mathematics. These articles treat their material at a fairly general level and aim to give an idea of the kind of problems, techniques and concepts involved in the area in question. They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions. The second kind of article of medium length contains more detailed concrete problems, results and techniques.

**Differential Geometric Methods in Theoretical Physics** Ling-Lie Chau, Werner Nahm, 2013-06-29

After several decades of reduced contact the interaction between physicists and mathematicians in the front line research of both fields recently became deep and fruitful again. Many of the leading specialists of both fields became involved in this development. This process even led to the discovery of previously unsuspected connections between various subfields of physics and mathematics. In mathematics this concerns in particular knots, von Neumann algebras, Kac-Moody algebras, integrable non-linear partial differential equations and differential geometry in low dimensions, most importantly in three and four dimensional spaces. In physics it concerns gravity, string theory, integrable classical and quantum field theories, solitons and the statistical mechanics of surfaces. New discoveries in these fields are made at a rapid pace. This conference brought together active researchers in these areas reporting their results and discussing with other participants to further develop thoughts in future new directions. The conference was attended by 50 participants from 15 nations. These proceedings document the program and the talks at the conference. This conference was preceded by a two week summer school. Ten lecturers gave extended lectures on related topics. The proceedings of the school will also be published in the NATO ASI volume by Plenum. The Editors
