

Microcomputer Systems

Outline:

- Components of microcomputer system
- Executing an instruction
- I/O devices
- Programming languages

Components of a Microcomputer System:

- Memory
 - Information processed by the computer is stored in its memory
- The CPU
 - In a microcomputer the CPU is a single chip processor known as microprocessor
- I/O Ports
 - System board or mother board contains expansion slots which are connectors for additional circuits boards called add in boards. I/O circuits are usually on these boards

Memory:

- A memory circuit element can store one bit of data
- Organized into groups that can store eight bits of data
- String of eight bits called a byte
- Each memory byte is identified by address
- The first memory byte has address 0
- The data stored in a memory byte called its contents or values
- The address of a memory byte is fixed and different from any other addresses whereas contents are not fixed
- The contents of memory byte are always eight bits but address depends on the processor. For example, some assign 20 bits address whereas some assign 24bit address.
- Bit Position
 - The positions are numbered from right to left starting with 0
 - Low byte comes from memory byte with lower address and high byte comes from memory byte with higher address

- Operations
 - Processor can perform two operations on memory: read(fetch) and write(store)
 - In read processor gets a copy of data and the contents of that location is unchanged whereas in write the data becomes the new content of the location
- RAM and ROM
 - Two kinds of memory circuits: RAM(Random Access Memory) and ROM(Read Only Memory)
 - RAM locations can be read and write but ROM locations only can be read
 - Program instructions and data normally loaded into RAM
 - System programs are stored in ROM
