*Integrating Large-Scale Genomic Information into Clinical Practice* Institute of Medicine, Board on Health Sciences Policy, Roundtable on Translating Genomic-Based Research for Health, 2012-02-06 The initial sequencing of the human genome carried out by an international group of experts took 13 years and 2.7 billion to complete In the decade since that achievement sequencing technology has evolved at such a rapid pace that today a consumer can have his or her entire genome sequenced by a single company in a matter of days for less than 10 000 though the addition of interpretation may extend this timeframe Given the rapid technological advances the potential effect on the lives of patients and the increasing use of genomic information in clinical care it is important to address how genomics data can be integrated into the clinical setting Genetic tests are already used to assess the risk of breast and ovarian cancers to diagnose recessive diseases such as cystic fibrosis to determine drug dosages

based on individual patient metabolism and to identify therapeutic options for treating lung and breast tumors melanoma and leukemia With these issues in mind and considering the potential impact that genomics information can have on the prevention diagnosis and treatment of disease the Roundtable on Translating Genomic Based Research for Health hosted a workshop on July 19 2011 to highlight and identify the challenges and opportunities in integrating large scale genomic information into clinical practice Integrating Large Scale Genomic Information into Clinical Practice summarizes the speaker presentations and the discussions that followed them This report focuses on several key topics including the analysis interpretation and delivery of genomic information plus workforce ethical and legal issues

*Genetic Disorders of the Indian Subcontinent* Dhavendra Kumar,2012-09-15 The Indian subcontinent is a vast land mass inhabited by over one billion people Its rich and varied history is reflected by its numerous racial and ethnic groups and its distinct religious cultural and social characteristics Like many developing countries in Asia it is passing through both demographic and epidemiological transitions whereby at least in some parts the diseases of severe poverty are being replaced by those of Westernisation obesity diabetes and heart disease for example Indeed as we move into the new millennium India has become a land of opposites on the one hand there is still extensive poverty yet on the other hand some of the most remarkable developments in commerce and technology in Asia are taking place notably in the fields of information technology and biotechnology India has always fascinated human geneticists and a considerable amount of work has been done towards tracing the origins of its different ethnic groups In the current excitement generated by the human genome project and the molecular and genetic approach to the study of human disease there is little doubt that this field will develop and flourish in India in the future Although so far there are limited data about genetic diseases in India enough is known already to suggest that this will be an extremely fruitful area of research
