**Mathematical Studies in Nonlinear Wave Propagation** Dominic P. Clemence, Guoqing Tang, 2005 Lively discussions and stimulating research were part of a five day conference on Mathematical Methods in Nonlinear Wave Propagation sponsored by the NSF and CBMS This volume is a collection of lectures and papers stemming from that event Leading experts present dynamical systems and chaos scattering and spectral theory nonlinear wave equations optimal control optical waveguide design and numerical simulation The book is suitable for a diverse audience of mathematical specialists interested in fiber optic communications and other nonlinear phenomena It is also suitable for engineers and other scientists interested in the mathematics of nonlinear wave propagation *Mathematical Studies on Human Disease Dynamics* Abba B. **Non-Linear Partial Differential Equations** E.E. Rosinger,1990-11-22 A massive transition of interest from solving

linear partial differential equations to solving nonlinear ones has taken place during the last two or three decades. The availability of better computers has often made numerical experimentations progress faster than the theoretical understanding of nonlinear partial differential equations. The three most important nonlinear phenomena observed so far both experimentally and numerically and studied theoretically in connection with such equations have been the solitons, shock waves and turbulence or chaotic processes. In many ways these phenomena have presented increasing difficulties in the mentioned order. In particular the latter two phenomena necessarily lead to nonclassical or generalized solutions for nonlinear partial differential equations.

[Mathematics of Complexity and Dynamical Systems](#)  
 Robert A. Meyers, 2011-10-05. Mathematics of Complexity and Dynamical Systems is an authoritative reference to the basic tools and concepts of complexity systems theory and dynamical systems from the perspective of pure and applied mathematics. Complex systems are systems that comprise many interacting parts with the ability to generate a new quality of collective behavior through self organization e.g. the spontaneous formation of temporal spatial or functional structures. These systems are often characterized by extreme sensitivity to initial conditions as well as emergent behavior that are not readily predictable or even completely deterministic. The more than 100 entries in this wide ranging single source work provide a comprehensive explication of the theory and applications of mathematical complexity covering ergodic theory, fractals and multifractals, dynamical systems, perturbation theory, solitons, systems and control theory and related topics. Mathematics of Complexity and Dynamical Systems is an essential reference for all those interested in mathematical complexity from undergraduate and graduate students up through professional researchers.

**Nonlinear Partial Differential Equations in Engineering by W F Ames**  
 W. F. Ames, 1972-07-21. In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems. A number of computing techniques are considered such as methods of operator approximation with any given accuracy, operator interpolation techniques including a non Lagrange interpolation method of system representation subject to constraints associated with concepts of causality, memory and stationarity, methods of system representation with an accuracy that is the best within a given class of models, methods of covariance matrix estimation, methods for low rank matrix approximations, hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory. As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression. Best operator approximation, Non Lagrange interpolation, Generic Karhunen Loeve transform, Generalised low rank matrix approximation, Optimal data compression, Optimal nonlinear filtering.
