Tuan Pham,2014-04-16 Freezing time and freezing heat load are the two most important factors determining the economics of food freezers This Brief will review and describe the principal methods available for their calculation The methods can be classified into analytical methods which rely on making physical simplifications to be able to derive exact solutions empirical methods which use regression techniques to derive simplified equations from experimental data or numerical calculations and numerical methods which use computational techniques such as finite elements analysis to solve the complete set of equations describing the physical process The Brief will evaluate the methods against experimental data and develop guidelines on the choice of method Whatever technique is used the accuracy of the results depends crucially on the input parameters such as the heat transfer coefficient and the product s thermal properties In addition the estimation methods and data for these

parameters will be reviewed and their impacts on the calculations will be evaluated Freezing is often accompanied by mass transfer moisture loss solute absorption super cooling and nucleation and may take place under high pressure conditions therefore methods to take these phenomena into account will also be reviewed Cost-Benefit Analysis for Project Appraisal Per-Olov Johansson,Bengt Kriström,2016 This book uses modern economic tools to obtain general equilibrium cost benefit rules It not only presents evaluation rules for small projects but also shows how to evaluate large projects as well as mega projects such as high speed rails and channel tunnels This is an excellent toolkit for graduate students and policymakers
