Mike Lord, 2003 Recent advances in our understanding of cells have put cell biology at the centre of biological and medical research Covers traditional and recently developed techniques and includes the detail necessary for immediate application in the laboratory **Molecular and Cellular Biology of Phagocytosis** Maurice B. Hallett, 2020-05-12 Phagocytosis is the engulfment of particulate matter by cells It is a fundamental and probably primitive

cell biological process which is important in single celled organisms such as amoeba multicellular animals including coelenterates and in higher animals In humans and other mammals specialised immune cells phagocytes utilise phagocytosis in their crucial role of engulfing and destroying infecting microbes Yet surprisingly the biophysics and biochemistry underlying the process has only become clear recently with the advent of genetic manipulation and advances in single cell imaging In this volume the aim is to bring together recent fundamental advances that give a clear picture of the underlying mechanism involved in phagocytosis Not only is this an important topic in its own right but a full understanding of the process will have a potential impact on human medicine since as antibiotics become less effective in fight infection researchers are looking at alternative approaches including enhancing the natural immunity brought about by immune phagocytes The aim is to provide a comprehensive volume on the topic with separate chapters on identified recent advances each written by the major contributors in each area In addition the volume will attempt to give a wider overview than is often the case in single author reviews with an emphasis here on the cell biological understanding of phagocytosis using biophysical approaches alongside the biochemical and imaging approaches
