Sources and Types of Data for Establishing Spacecraft Water Exposure Guidelines

IN this chapter, the Subcommittee on Spacecraft Water Exposure Guidelines describes the sources and types of data that should be used for establishing spacecraft water exposure guidelines (SWEGs). This information is similar to that described in the National Research Council's (NRC 1992) *Guidelines for Developing Spacecraft Maximum Allowable Concentrations for Space Station Contaminants* (SMACs), but with important differences. First, the major route of exposure considered in SMACs is inhalation, whereas the major expected route of exposure considered in SWEGs is oral, via ingestion of drinking water and food prepared in potable water. Dermal absorption and inhalation could be secondary routes of exposure. Second, the SWEGs should incorporate advances in the understanding of human physiology and metabolism in microgravity that have occurred since the SMACs were published. Third, the duration of the exposures of interest is different for contaminants in drinking water, because exposure can be avoided if necessary by not drinking the water from the potable drinking-water supply of the spacecraft (emergency supplies could be made available for short periods). It is much more difficult to avoid contact with the ambient air in a spacecraft.

Methods For Developing Spacecraft Water Exposure Guidelines
