Methods In Membrane Biology Volume 4 Biophysical Approaches:

Methods in Membrane Biology Edward Korn, 2012-12-06 Many of the methods now in general use in membrane biology and not already discussed in satisfactory detail elsewhere have been covered in the eight previously published volumes of this series Much of this ninth volume is occupied by one authoritative chapter an unusually thorough and critical review of a relatively new and highly specialized technology that has gained rapid acceptance immunofluorescence and immunoelectron microscopy These are powerful experimental tools applicable in fields much broader than membrane research and employing methods drawn from widely diverse disciplines such as organic chemistry protein chemistry immunology and fluorescence and electron microscopy The temptation to use these superficially and deceptively simple but fundamentally complex methods uncritically is almost overwhelming The chapter by de Petris a pioneer in the field is as necessary as it is rigorous and it should long be the standard in this area of research The second chapter in this volume is a more specialized review by Matus of the procedures for the preparation and characterization of the highly differentiated junctional regions of brain plasma membranes These methods are central to the rapidly growing field of neurobiochemistry membrane biochemistry at perhaps its most intricate

Methods in Membrane Biology Edward D. Korn, 2012-12-06 Although not the only volume in this series in which lipids are discussed the present volume is devoted entirely to methods for the study of membrane lipids Even now when membrane proteins are properly receiving so much attention this emphasis on membrane lipids is appropriate Essentially all of the phospholipids and sterols of cells are in membranes Moreover although membrane proteins are certainly of utmost importance the more we learn about the functional properties of membrane proteins the more we appreciate the unique features of phospholipids without which biological membranes would be impossible The hydrophobic hydrophilic duality of phospholipids allows indeed requires their association in an aqueous environment into an essentially two dimensional membrane only molecularly thick in one dimension but relatively infinite in the other two a structure composed of small molecules not covalently linked and therefore infinitely mobile and variable but yet a structure with great stability and one largely impermeable to most biomolecules These membrane forming properties are shared by many amphipathic polar lipids phospholipids glycolipids and sphingolipids that differ significantly from each other in the nature of their polar head groups and their fatty acids These variations in structure allow a range of specific interactions among membrane lipids and between lipids and proteins and also provide for membranes of variable but controlled fluidity In this way phospholipids provide an appropriate milieu for functional membrane proteins and also significantly modulate their catalytic activities *Methods in Membrane Biology*, 1976

Biophysical Approaches Edward D. Korn, 2013-04-17 The short period since the publication of Volume 1 of *Methods in Membrane Biology* has been a time of momentous progress Calorimetry electron spin and nuclear magnetic resonance X ray diffraction and freeze cleavage electron microscopy reinforced by biochemical analyses and enzymatic studies have led to universal acceptance of a generalized membrane model

All membrane biologists would agree that a major element of all biological membranes is a bilayer of phospholipids which in some instances also contains other lipids notably sterols and glycolipids. The fatty acid composition of the lipids of most membranes is such that the lipids are above their transition temperatures in their normal environment so that the bilayer is fluid. The microviscosity of the fatty acyl groups decreases progressively down the chain so that at the hydrocarbon interior of the bilayer the lipid phase has a viscosity approximating that of olive oil at room temperature. As a consequence of this membrane fluidity a phospholipid molecule is very mobile within the plane of the membrane moving a distance of about 1.2 μm in 1 s but the movement of a phospholipid molecule from one side of the membrane bilayer to the other flip flop is very slow. The lipid bilayer is an essentially inert and rather impermeable structure as shown by many studies with model systems. Proteins of course provide the catalytic components of the membranes as well as playing a significant structural role. **Gel**

Permeation and Ion-Exchange Chromatography of Proteins and Peptides Kato, Simone Parvez, Hasan

Parvez, 2020-03-24 This book is a collection of critical reviews of the use of high performance liquid chromatography in a very specialized area of research. It describes in detail modern methodology to separate nucleic acids, enzymes and a wide variety of biologically active proteins such as renin. *Transport* Edward D. Korn, 2013-03-09 One property common to all cells is transport. Molecules and ions must enter and leave cells by crossing membranes in a controlled manner. The process may take any of several forms: simple diffusion, carrier mediated diffusion, active transport or group translocation. There is more than one way to measure each. Transport kinetics with particular reference to the red blood cell were discussed in a previous volume. Three chapters deal with the general subject of transport in this volume. Maloney, Kashket and Wilson summarize the appropriate methodology for studying metabolite and ion transport in bacteria and Kimmich describes the relevant methodology for the isolated intestinal epithelial cell. The methods described in these two chapters have general application to transport studies in single cells from any source. The approach described in these two complementary articles is extended in the chapter by Hochstadt and her collaborators on the use of isolated membranes from bacterial and mammalian cells for the study of transport phenomena. If one can prepare a suitable plasma membrane fraction, sealed impermeable vesicles with the necessary transport components intact, it becomes possible to separate the events of transport from any subsequent metabolism that may occur in the cell. Isolated membrane vesicles are relatively easy to obtain from bacteria and they are comparatively well studied. Work with similar preparations from cultured mammalian cells is just beginning but has much promise. **Catalog of Copyright Entries. Third Series** Library of Congress. Gordon, 1988 Biophysical Approaches for the Study of Membrane Structure Part A, 2024-07-05 Biophysical Approaches for the Study of Membrane Structure Part A Volume 700 explores lipid membrane asymmetry and lateral heterogeneity. A burst of recent research has shown that bilayers whose leaflets differ in their physical properties such as composition, phase

state or lateral stress exhibit many fascinating new characteristics but also pose a host of new challenges related to their creation characterization simulation and theoretical description Chapters in this new release include Evaluation of functional transbilayer coupling in live cells by controlled lipid exchange and imaging FCS Effects of lateral and hydrostatic pressure on membrane structure and properties and much more Other sections cover Using the yeast vacuole as a system to test the lipid drivers of membrane heterogeneity in living cells Direct quantification of cellular membrane lipids using ratiometric fluorescence sensors The spectral phasor approach to resolving membrane order with environmentally sensitive dyes The use of hemifusion to create asymmetric giant unilamellar vesicles Insights on induced order domains Advanced microscopy methods to study membrane pores Use of cryo EM to study membrane phase separation and much more Explore the state of the art of lipid membrane asymmetry Covers experimental theoretical and computational techniques to create and characterize asymmetric lipid membranes Teaches how these kinds of approaches create and characterize laterally inhomogeneous membranes
