Methods In Nonlinear Analysis:

Methods in Nonlinear Analysis Kung-Ching Chang, 2005-11-21 Nonlinear analysis has developed rapidly in the last three decades. Theories, techniques and results in many different branches of mathematics have been combined in solving nonlinear problems. This book collects and reorganizes up to date materials scattered throughout the literature from the methodology point of view and presents them in a systematic way. It contains the basic theories and methods with many interesting problems in partial and ordinary differential equations, differential geometry and mathematical physics as applications and provides the necessary preparation for almost all important aspects in contemporary studies. There are five chapters that cover linearization, fixed point theorems based on compactness and convexity, topological degree theory, minimization and topological variational methods. Each chapter combines abstract, classical and applied analysis. Particular topics included are bifurcation, perturbation, gluing technique, transversality, Nash-Moser technique, Ky Fan's inequality and equilibrium in game theory, set-valued mappings and differential equations with discontinuous nonlinear terms, multiple solutions in partial differential equations, direct method, quasiconvexity and relaxation, Young measure, compensation compactness method and Hardy space, concentration compactness and best constants, Ekeland variational principle, infinite dimensional Morse theory, minimax method, index theory with group action and Conley index theory. All methods are illustrated by carefully chosen examples from mechanics, physics, engineering and geometry. The book aims to find a balance between theory and applications and will contribute to filling the gap between texts that either only study the abstract theory or focus on some special equations.

Lyapunov-Schmidt Methods in Nonlinear Analysis and Applications Nikolay Sidorov, Boris Loginov, A.V. Sinitsyn, M.V. Falaleev, 2002-10-31 Recent theory and applications of the Lyapunov-Schmidt method are presented in this specialized volume of use to mathematicians, physicists and engineers interested in nonlinear equations. The chapters describe the Lyapunov-Schmidt method and its use for obtaining branching solutions for nonlinear equations using iterative techniques, techniques for constructing regularizing equations, the use of power geometry methods, the theory of branching for interlaced equations, applications of ideas of symmetry in the theory of bifurcations, applications in differential operator equations and applied problems of mathematical physics. The four authors are Russian mathematicians who teach at the Irkutsk State U and the Ulyanovsk State Technical U in Russia and the National U of Colombia in Bogota. Methods of Nonlinear Analysis Richard Bellman, 1973

Methods of Nonlinear Analysis Pavel Drabek, Jaroslav Milota, 2007-06-28 In this book the basic methods of nonlinear analysis are emphasized and illustrated in simple examples. Every considered method is motivated, explained in a general form but in the simplest possible abstract framework. Its applications are shown particularly to boundary value problems for elementary ordinary or partial differential equations. The text is organized in two levels: a self-contained basic and organized in appendices an advanced level for the more experienced reader. Exercises are an organic part of the exposition and

This book focuses on nonlinear boundary value problems and the aspects of nonlinear analysis which are necessary to their study. The authors first give a comprehensive introduction to the many different classical methods from nonlinear analysis: variational principles and Morse theory. They then provide a rigorous and detailed treatment of the relevant areas of nonlinear analysis with new applications to nonlinear boundary value problems for both ordinary and partial differential equations. Recent results on the existence and multiplicity of critical points for both smooth and nonsmooth functional developments on the degree theory of monotone type operators, nonlinear maximum and comparison principles for p -Laplacian type operators and new developments on nonlinear Neumann problems involving non homogeneous differential operators appear for the first time in book form. The presentation is systematic and an extensive bibliography and a remarks section at the end of each chapter highlight the text. This work will serve as an invaluable reference for researchers working in nonlinear analysis and partial differential equations as well as a useful tool for all those interested in the topics presented.
