Rings of Quotients B. Stenström, 2012-12-06 The theory of rings of quotients has its origin in the work of J. Ore and K. Asano on the construction of the total ring of fractions in the 1930s and 40s. But the subject did not really develop until the end of the 1950s when a number of important papers appeared by R. E. Johnson, Y. Utumi, A. W. Goldie, P. Gabriel, J. Lambek and others. Since then the progress has been rapid and the subject has by now attained a stage of maturity where it is possible to make a systematic account of it which is the purpose of this book. The most immediate example of a ring of quotients is the field of fractions Q of a commutative integral domain A . It may be characterized by the two properties: i) For every $q \in Q$ there exists a non zero $s \in A$ such that $qs \in A$; ii) Q is the maximal over ring of A satisfying condition i). The well known construction of Q can be immediately extended to the case when A is an arbitrary commutative ring and S is a multiplicatively closed set of non zero divisors of A . In that case one defines the ring of fractions $Q_A(S)$ as consisting of pairs (a, s) with $a \in A$ and $s \in S$ with the declaration that $(a, s) \sim (b, t)$ if there exists $u \in S$ such that $u(a, s) = (b, t)$. The resulting ring Q satisfies i) with the extra requirement that $S \subseteq Q$ and ii).

Homotopy Methods in Topological Fixed and Periodic Points Theory Jerzy Jezierski, Waclaw Marzantowicz, 2006-01-17 The notion of a fixed point plays a crucial role in numerous branches of mathematics and its applications Information about the existence of such points is often the crucial argument in solving a problem In particular topological methods of fixed point theory have been an increasing focus of interest over the last century These topological methods of fixed point theory are divided roughly speaking into two types The first type includes such as the Banach Contraction Principle where the assumptions on the space can be very mild but a small change of the map can remove the fixed point The second type on the other hand such as the Brouwer and Lefschetz Fixed Point Theorems give the existence of a fixed point not only for a given map but also for any its deformations This book is an exposition of a part of the topological fixed and periodic point theory of this second type based on the notions of Lefschetz and Nielsen numbers Since both notions are homotopy invariants the deformation is used as an essential method and the assertions of theorems typically state the existence of fixed or periodic points for every map of the

whole homotopy class we refer to them as homotopy methods of the topological fixed and periodic point theory
