Molecular Chaperones In Health And Disease Handbook Of Experimental Pharmacology:

Molecular Chaperones in Health and Disease Matthias Gaestel,2005-12-29 Molecular chaperones are involved in a wide variety of essential cellular processes in living cells A subset of molecular chaperones have been initially described as heat shock proteins protecting cells from stress damage by keeping cellular proteins in a folding competent state and preventing them from irreversible aggregation Later it became obvious that molecular chaperones are also expressed constitutively in the cell and are involved in complex processes such as protein synthesis intracellular protein transport post translational modification and secretion of proteins as well as receptor signalling Hence it is not surprising that molecular chaperones are implicated in the pathogenesis of many relevant diseases and could be regarded as potential pharmacological targets Starting with the analysis of the mode of action of chaperones at the molecular cellular and organismic level this book will then describe specific aspects where modulation of chaperone action could be of pharmacological and therapeutic interest

Dimethyl Sulfoxide (DMSO) in Trauma and Disease Stanley W. Jacob,Jack C. de la Torre,2015-04-07 First isolated as a chemical compound by a Russian chemist in 1866 dimethyl sulfoxide DMSO proved to be a near perfect solvent for decades before its remarkable biological and medical activities were discovered DMSO is one of the most prodigious agents ever to come out of the world of drug development Its wide range of biological actions invol **Heat Shock Proteins in Cancer** Stuart K. Calderwood,Michael Y. Sherman,Daniel R. Ciocca,2007-09-09 Heat shock proteins are emerging as important molecules in the development of cancer and as key targets in cancer therapy These proteins enhance the growth of cancer cells and protect tumors from treatments such as drugs or surgery However new drugs have recently been developed particularly those targeting heat shock protein 90 As heat shock protein 90 functions to stabilize many of the oncogenes and growth promoting proteins in cancer cells such drugs have broad specificity in many types of cancer cell and offer the possibility of evading the development of resistance through point mutation or use of compensatory pathways Heat shock proteins have a further property that makes them tempting targets in cancer immunotherapy These proteins have the ability

to induce an inflammatory response when released in tumors and to carry tumor antigens to antigen presenting cells They have thus become important components of anticancer vaccines Overall heat shock proteins are important new targets in molecular cancer therapy and can be approached in a number of contrasting approaches to therapy Advances in Cancer Research George F.
