Functional Gradient Materials and Surface Layers Prepared by Fine Particles Technology Marie-Isabelle Baraton, Irina V. Uvarova, 2001-03-31 The term functional gradient materials was coined in Japan in the 1980s to describe a class of materials having spatially homogenous microstructures and properties These materials can be used successfully in such applications as electronic devices optical films anti wear and anti corrosion coatings thermal barrier coatings and biomaterials The materials are fabricated with the use of nanoparticles leading to greatly improved performance Nanoparticle technology is not straightforward however demanding a modification of methods for processing and characterization This book provides graduate students postdoctoral fellows engineers and senior scientists with an in depth review of aspects of the field ranging from synthetic methods to a variety of applications The different approaches to material synthesis are described giving the reader a better understanding of the complex phenomena involved Characterization and the evaluation of properties are also discussed

Applications of Organometallic Chemistry in the Preparation and Processing of Advanced Materials J.F. Harrod, R.M. Laine, 2012-12-06 In the ten years since the scientific rationale for the design synthesis and application of inorganic and organometallic polymers IOPs was first conceptualised we have witnessed the first tentative exploration of IOPs as precursors to new materials with efforts focusing on the design and synthesis of novel ceramic precursors Developing expertise led to precursor studies combined with the characterisation of the transformation processes that occur when IOPs are converted to ceramic materials Now at maturity the science presented in this volume reveals the polymer precursor approach to materials synthesis together with examples of processing ceramic shapes for a range of mechanical properties the development of sophisticated noninvasive analytical techniques and IOP design rationales relying on well defined processing property relationships The production of multifunctional IOPs is described providing ion conductivity gas sensing bioactivity magnetic properties etc combined with processability The existence of well defined IOPs and the exquisite control that can be exerted on sol gel systems now provide access to such a variety of mixed organic organometallic and or inorganic hybrid systems that their exploitation is likely to develop into an entirely new field of materials chemistry Future exciting avenues of research are also being opened up with the advent of buckyballs Met Cars dopable preceramics rigid rod organometallics and molecular tinkertoys
