Convective Heat and Mass Transfer in Porous Media Sadik Kakaç, Birol Kilis, Frank A. Kulacki, Faruk Annç, 2012-12-06 The rapid growth of literature on convective heat and mass transfer through porous media has brought both engineering and fundamental knowledge to a new state of completeness and depth Additionally several new questions of fundamental merit have arisen in several areas which bear direct relation to further advancement of basic knowledge and applications in this field For example the growth of fundamental heat transfer data and correlations for engineering use for saturated media has now reached the point where the relations for heat transfer coefficients and flow parameters are known well enough for design purposes Multiple flow field regimes in natural convection have been identified in several important enclosure geometries New questions have arisen on the nature of equations being used in theoretical studies i e the Validity of Darcy assumption is being brought into question Wall effects in high and low velocity flow fields have been found to play a role in predicting transport coefficients The formulation of transport problems in fractured media are being investigated as both an extension of those in a homogeneous medium and for application in engineering systems in geologic media and problems on saturated media are being addressed to determine their proper formulation and solution The long standing problem of how to adequately formulate and solve problems of multi phase heat and mass transfer in heterogeneous media is important in the technologies of chemical reactor engineering and enhanced oil recovery

Computational Heat Transfer Yogesh Jaluria, 2017-10-19 This new edition updated the material by expanding coverage of certain topics adding new examples and problems removing outdated material and adding a computer disk which will be included with each book Professor Jaluria and Torrance have structured a text addressing both finite difference and finite element methods comparing a number of applicable methods

Fundamentals of Atmospheric Radiation Craig F. Bohren, Eugene E. Clothiaux, 2006-08-21 Meeting the need for teaching material suitable for students of atmospheric science and courses on atmospheric radiation this textbook covers the fundamentals of emission absorption and scattering of electromagnetic radiation from ultraviolet to infrared and beyond Much of the contents applies to planetary atmosphere with graded discussions providing a thorough treatment of subjects including single scattering by particles at different levels of complexity The discussion of the simple multiple scattering theory introduces concepts in more advanced theories such that the more complicated two stream theory allows readers to progress beyond the pile of plates theory The authors are physicists teaching at the largest meteorology department in the US at Penn State The problems given in the text come from students colleagues and correspondents and the figures designed especially for this book facilitate comprehension Ideal for advanced undergraduate and graduate students of atmospheric science Free solutions manual available for lecturers at www.wiley-vch.de/supplements

Advances in Heat Transfer James P. Hartnett, 2002-07-25 **Advances in Heat Transfer** **High Temperature Phenomena in Shock Waves** Raymond

Brun,2012-01-24 The high temperatures generated in gases by shock waves give rise to physical and chemical phenomena such as molecular vibrational excitation dissociation ionization chemical reactions and inherently related radiation In continuum regime these processes start from the wave front so that generally the gaseous media behind shock waves may be in a thermodynamic and chemical non equilibrium state This book presents the state of knowledge of these phenomena Thus the thermodynamic properties of high temperature gases including the plasma state are described as well as the kinetics of the various chemical phenomena cited above Numerous results of measurement and computation of vibrational relaxation times dissociation and reaction rate constants are given and various ionization and radiative mechanisms and processes are presented The coupling between these different phenomena is taken into account as well as their interaction with the flow field Particular points such as the case of rarefied flows and the inside of the shock wave itself are also examined Examples of specific non equilibrium flows are given generally corresponding to those encountered during spatial missions or in shock tube experiments **Proceedings of the ASME Heat Transfer Division** ,2007 Applied mechanics reviews ,1948
