Germany in September 1993 on the subject of Novikov Conjectures Index Theorems and Rigidity They are intended to give a snapshot of the status of work on the Novikov Conjecture and related topics from many points of view geometric topology homotopy theory algebra geometry analysis **The Novikov Conjecture** Matthias Kreck, Wolfgang Lück, 2005-12-05 These lecture notes contain a guided tour to the Novikov Conjecture and related conjectures due to Baum Connes Borel and Farrell Jones They begin with basics about higher signatures Whitehead torsion and the s Cobordism Theorem Then an introduction to surgery theory and a version of the assembly map is presented Using the solution of the Novikov conjecture for special groups some applications to the classification of low dimensional manifolds are given L2-Invariants: Theory and Applications to Geometry and K-Theory Wolfgang Lück, 2013-03-09 In algebraic topology some classical invariants such as Betti numbers and Reidemeister torsion are defined for compact spaces and finite group actions They can be generalized using von Neumann algebras and their traces and applied also to non compact spaces and infinite groups These new L2 invariants contain very interesting and novel information and can be applied to problems arising in topology K Theory differential geometry non commutative geometry and spectral theory It is particularly these interactions with different fields that make L2 invariants very powerful and exciting The book presents a comprehensive introduction to this area of research as well as its most recent results and developments It is written in a way which enables the reader to pick out a favourite topic and to find the result she or he is interested in quickly and without being forced to go through other material

Recent Progress in General Topology III K.P. Hart, J. van Mill, P. Simon, 2013-12-11 The book presents surveys describing recent developments in most of the primary subfields of General Topology and its applications to Algebra and Analysis during the last decade following the previous editions North Holland 1992 and 2002 The book was prepared in connection with the Prague Topological Symposium held in 2011 During the last 10 years the focus in General Topology changed and therefore the selection of topics differs from that chosen in 2002 The following areas experienced significant developments Fractals Coarse Geometry Topology Dimension Theory Set Theoretic Topology and Dynamical Systems **Variations on a Theme of Borel** Shmuel Weinberger, 2022-12-08 In the middle of the last century after hearing a talk of Mostow on one of his rigidity theorems Borel conjectured in a letter to Serre a purely topological version of rigidity for aspherical manifolds i.e. manifolds with contractible universal covers The Borel conjecture is now one of the central problems of topology with many implications for manifolds that need not be aspherical Since then the theory of rigidity has vastly expanded in both precision and scope This book rethinks the implications of accepting his heuristic as a source of ideas Doing so leads to many variants of the original conjecture some true some false and some that remain conjectural The author explores this collection of ideas following them where they lead whether into rigidity theory in its differential geometric and representation theoretic forms or geometric group theory metric geometry global analysis algebraic geometry K theory or controlled topology Handbook of K-Theory Eric Friedlander, Daniel R. Grayson, 2005-07-18 This handbook offers a compilation of techniques and results in K

theory Each chapter is dedicated to a specific topic and is written by a leading expert Many chapters present historical background some present previously unpublished results whereas some present the first expository account of a topic many discuss future directions as well as open problems It offers an exposition of our current state of knowledge as well as an implicit blueprint for future research

European Congress of Mathematics Carles Casacuberta, Rosa M. Miro-Roig, Joan Verdera, Sebastia Xambo-Descamps, 2012-12-06 This is the second volume of the proceedings of the third European Congress of Mathematics Volume I presents the speeches delivered at the Congress the list of lectures and short summaries of the achievements of the prize winners as well as papers by plenary and parallel speakers The second volume collects articles by prize winners and speakers of the mini symposia This two volume set thus gives an overview of the state of the art in many fields of mathematics and is therefore of interest to every professional mathematician

Ends of Complexes Bruce Hughes, Andrew Ranicki, 1996-08-28 A systematic exposition of the theory and practice of ends of manifolds and CW complexes not previously available

The Ubiquitous Heat Kernel Jay Jorgenson, 2006 The aim of this volume is to bring together research ideas from various fields of mathematics which utilize the heat kernel or heat kernel techniques in their research The intention of this collection of papers is to broaden productive communication across mathematical sub disciplines and to provide a vehicle which would allow experts in one field to initiate research with individuals in another field as well as to give non experts a resource which can facilitate expanding their research and connecting with others

K-Theory for Group C*-Algebras and Semigroup C*-Algebras Joachim Cuntz, Siegfried Echterhoff, Xin Li, Guoliang Yu, 2017-10-24 This book gives an account of the necessary background for group algebras and crossed products for actions of a group or a semigroup on a space and reports on some very recently developed techniques with applications to particular examples Much of the material is available here for the first time in book form The topics discussed are among the most classical and intensely studied C algebras They are important for applications in fields as diverse as the theory of unitary group representations index theory the topology of manifolds or ergodic theory of group actions Part of the most basic structural information for such a C algebra is contained in its K theory The determination of the K groups of C algebras constructed from group or semigroup actions is a particularly challenging problem Paul Baum and Alain Connes proposed a formula for the K theory of the reduced crossed product for a group action that would permit in principle its computation By work of many hands the formula has by now been verified for very large classes of groups and this work has led to the development of a host of new techniques An important ingredient is Kasparov's bivariant K theory More recently also the C algebras generated by the regular representation of a semigroup as well as the crossed products for actions of semigroups by endomorphisms have been studied in more detail Intriguing examples of actions of such semigroups come from ergodic theory as well as from algebraic number theory The computation of the K theory of the corresponding crossed products needs new techniques In cases of interest the K theory of the algebras reflects ergodic theoretic or number theoretic
