Open Issues in Core Collapse Supernova Theory Anthony Mezzacappa, George Michael Fuller, 2005 Efforts to uncover the explosion mechanism of core collapse supernovae and to understand all of their associated phenomena have been ongoing for nearly four decades Despite this our theoretical understanding of these cosmic events remains limited two and three dimensional modeling of these events is in its infancy Most of the modeling efforts over the past four decades have by necessity been constrained to spherical symmetry with the first two dimensional albeit simplified models appearing only during the last decade Simulations to understand the complex interplay between the turbulent stellar core fluid flow its magnetic fields the neutrinos produced in and emanating from the proto neutron star the stellar core rotation and the strong gravitational fields have yet to be performed Only subsets of these

fundamental ingredients have been included in the models thus far often with approximation The purpose of this volume is to identify the outstanding issues that remain in order to come to a complete understanding of these important astrophysical events As the book focuses on open issues rather than the current state of the art in the field although the latter will certainly be discussed it will remain relevant for some time

A Compendium of Geochemistry Yuan-Hui Li, 2000-10-22 A general understanding of these principles and processes including those pertaining to cosmology geology and biology is essential maintains the author for deciphering and predicting transport pathways and final sinks of anthropogenic pollutants in our environment

Structure and Evolution of Single and Binary Stars
C. de Loore, C. Doom, 2012-12-06 Classical stellar evolution theories have undergone some drastic changes in recent decades New insights into the development of stellar interiors were obtained from studying stars in various stages of their lives as well as with the help of fast computers which gave a boost to the branch of numerical modelling of stellar structure and evolution This book is divided into two parts The first part deals with the general aspects of stellar structure and evolution including a chapter on numerical modelling The second part deals with specific evolutionary aspects of single and binary stars with a variety of masses The last chapter gives several models of stars with specific masses The book is intended as an introduction for students as well as a reference for researchers

The Role of Conference Literature in Sci-Tech Libraries Ellis Mount, 2019-12-05 Most librarians working with sci tech collections are fully aware of the importance of conference papers and proceedings which has long played a major role in keeping professionals informed of the latest developments in their field In this book first published in 1989 responsible executives from several publishers of conference literature have joined with a number of sci tech librarians to discuss the nature and value of conference literature in sci tech libraries A commercial publisher discusses the difficulties in editing a set of conference papers in a book while producers of indexing abstracting tools describe their selection methods retrieval services and general outlook on conference materials In addition sci tech librarians address the problems of accessing citing and locating conference literature and explore the many aspects of the cataloguing of conference publications

The Impact of Very High S/N Spectroscopy on Stellar Physics International Astronomical Union. Symposium, 1988-04-30 Proceedings of the 132nd Symposium of the International Astronomical Union held in Paris France June 29 July 3 1987

From Nucleons to the Atomic Nucleus Kris Heyde, 2013-03-09 The present text grew out of a number of lecture courses for advanced under graduate and new graduate students in nuclear physics They were given at summer schools in Leuven Melbourne and at study weeks for Dutch graduate students which aimed to emphasize fundamental and topical aspects of nuclear physics On occasion part of the present text was presented to students from a much wider field than just nuclear physics and also within a number of general physics colloquia where in addition to nuclear physicists physicists from many other fields were present In this respect the intention is to present in an amply illustrated

form the key questions that arise in nuclear physics At the same time we try to show why a better understanding of the atomic nucleus is not only important in itself but also yields essential insights into the many connections to other fields of physics We thus concentrate on the unifying themes rather than addressing in great detail particular subfields of nuclear physics The present project does not aim to be another comprehensive textbook on nuclear physics Many of the detailed technical arguments that enter into the picture are not developed here as they would be in a more standard textbook Instead they are presented using analogies quite often with simple pictures and arguments that try to convey the general line of thinking and working in nuclear physics

Planetary Sciences National Academy of Sciences, Division on Engineering and Physical Sciences, Commission on Engineering and Technical Systems, 1991-02-01 This book contains the proceedings from a workshop on planetary sciences sponsored by the Academy of Sciences of the USSR and the National Academy of Sciences The proceedings include papers written by American and Soviet scientists who examine the current theoretical understanding of how the planets were formed and how they evolved to their present state They assess the type of observations and experiments that are needed to advance understanding of the formation and evolution of the solar system based on the current theoretical framework

Handbook of Nuclear Physics Isao Tanihata, Hiroshi Toki, Toshitaka Kajino, 2023-09-04 This handbook is a comprehensive systematic source of modern nuclear physics It aims to summarize experimental and theoretical discoveries and an understanding of unstable nuclei and their exotic structures which were opened up by the development of radioactive ion RI beam in the late 1980s The handbook comprises three major parts In the first part the experiments and measured facts are well organized and reviewed The second part summarizes recognized theories to explain the experimental facts introduced in the first part Reflecting recent synergistic progress involving both experiment and theory the chapters both parts are mutually related The last part focuses on cosmological nuclear physics one of the mainstream subjects in modern nuclear physics Those comprehensive topics are presented concisely Supported by introductory reviews all chapters are designed to present their topics in a manner accessible to readers at the graduate level The book therefore serves as a valuable source for beginners as well helping them to learn modern nuclear physics

High Energy Astrophysics Gerhard Börner, 2012-12-06 The second workshop on High Energy Astrophysics of the Max Planck Society and the Academia Sinica was held at Ringberg Castle near Tegernsee during the week July 12 July 17 1987 It is the purpose of these workshops to encourage the exchange of ideas between German and Chinese astrophysicists scientists from other countries are also welcome of course and the pleasant atmosphere and surroundings of Ringberg Castle certainly helped the development of relaxed and stimulating discussions In addition we seemed to have picked out the one week of perfect weather during a rainy summer Thanks are due to Mr Hormann and his staff for creating a perfect infrastructure The proceedings have required a considerable amount of editing and I hope that all the papers are comprehensible Thanks are due to Miss Petra Berkemeyer and Miss Hannelore Muller who patiently retyped several manuscripts and helped with

other editing jobs I did not feel that a sharp refereeing procedure should be done although I do not agree with all the papers in this volume. The interested reader will find that this book gives a fair account of the present status of Chinese activities in the field of high energy astrophysics i.e. in supernova physics, accretion onto compact objects, active galaxies and cosmology.

Astronomy with Radioactivities Roland Diehl, Dieter H. Hartmann, Nikos Prantzos, 2010-10-02. This book introduces the reader to the field of nuclear astrophysics i.e. the acquisition and reading of measurements on unstable isotopes in different parts of the universe. The authors explain the role of radioactivities in astrophysics, discuss specific sources of cosmic isotopes and in which special regions they can be observed. More specifically, the authors address stars of different types, stellar explosions which terminate stellar evolutions and other explosions triggered by mass transfers and instabilities in binary stars. They also address nuclear reactions and transport processes in interstellar space in the contexts of cosmic rays and of chemical evolution. A special chapter is dedicated to the solar system which even provides material samples. The book also contains a description of key tools which astrophysicists employ in those particular studies and a glossary of key terms in astronomy with radioactivities.

Astrophysics with Radioactive Isotopes Roland Diehl, Dieter H. Hartmann, Nikos Prantzos, 2018-10-11. Dealing with astrophysics derived from the radiation emitted by radioactive atomic nuclei, this book describes the different methods used to measure cosmic radio isotopes. It demonstrates how this astronomical window has contributed to the understanding of the sources and the chemical evolution of cosmic gas. Reference materials and explanations are included for students in advanced stages of their education. Nuclear reactions in different sites across the universe lead to the production of stable and unstable nuclei. Their abundances can be measured through different methods allowing to study the various nuclear processes taking place in cosmic environments. Nucleosynthesis is the cosmic formation of new nuclear species starting from hydrogen and helium resulting from the big bang origins. Stars create and eject synthesized nuclei during their evolution and explosions. Incorporation of the new interstellar composition into next generation stars characterises the compositional chemical evolution of cosmic gas in and between galaxies. Radioactive species have unique messages about how this occurs. Since the first Edition of this book published in 2011 with the title *Astronomy with Radioactivities*, long awaited new direct observations of supernova radioactivity have been made and are now addressed in two updated chapters dealing with supernovae. In this second Edition, the advances of recent years beyond one dimensional treatments of stellar structure and stellar explosions towards 3 dimensional models have been included and led to significant re-writings in Chapters 3-5. The sections on the Solar System origins have been re-written to account for new insights into the evolution of giant molecular clouds. The chapter on diffuse radioactivities now also includes material measurements of radioactivities in the current solar system and their interpretations for recent nucleosynthesis activity in our Galaxy. Significant new results on gamma rays from positron annihilations have been accounted for in that chapter and led to new links with nucleosynthesis sources as well as interstellar transport processes. A new chapter now provides a

description of interstellar processes often called chemical evolution thus linking the creation of new nuclei to their abundance observations in gas and stars The experimental instrumental chapters on nuclear reaction measurements on gamma ray telescopes and pre solar grain laboratories have been updated Moreover new windows of astronomy that have been opened up in recent years have been included in the discussions of the multi messenger approach that broadens the basis for astrophysical insights **Astrophysical Ages and Dating Methods** Elisabeth Vangioni-Flam,1990
