

Respiratory Care Modalities Return Demonstration

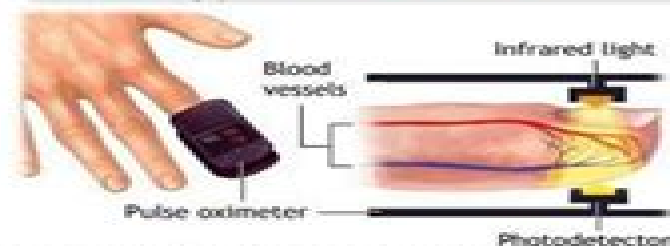

J.A.K.E

NCMB 312 RLE

PULSE OXIMETRY

- is one of the most commonly employed monitoring modalities in the critical care setting.
- A good indicator of the oxygenation status of a person, especially hypoxemia.

Parts

- A pulse oximeter reads the concentration of oxygen bound to hemoglobin in the blood by shining infrared and red light through a translucent part of the body and measuring the ratio of light reflected and light absorbed by oxygenated and deoxygenated hemoglobin
- Oxygen that is inhaled from the atmosphere diffuses through the lungs and into the bloodstream to be used up by body tissues for energy
- the oxygen is bound to the hemoglobin component of a red blood
- few are dissolved in plasma
- 95% - 100% - Normal SpO₂ or Normal oxygen saturation of the peripheral blood
- below 95% - Hypoxemia
- 85% and below - Critical level
- Cerebral hypoxia (low oxygen level in the brain) may follow in a few minutes and cause irreversible brain damage. Several vital organs might also be affected. The person warrants immediate treatment and oxygenation.
- **Where Can You Use A Pulse Oximeter?**
 - To be able to get an accurate reading, a pulse oximeter probe must be placed on a translucent part of the body so that light emitted from the light transmitter will be received by the photodetector on the opposite side

Fingertip

- most accessible segment of the body
- nail polish/ varnish can affect the measurement of oxygen saturation, particularly black, green, and blue

Nail varnish

This is picture of nail varnish – why does it interfere with pulse oximetry?

The colour can absorb light emitted by the oximeter and interfere with the detection of oxygenated haemoglobin.

It is always best to remove nail varnish from one finger. In emergencies the probe may be turned sideways. Use another site if possible.

Toes

- as good as the fingers as a pulse oximeter measuring site
- helpful in detecting problems in arterial blood flow such as in lower extremity arterial disease
- Earlobe
- can be clipped either on the tip or lower part of the pinna (earlobe)
- medical anomalies with the hands or fingers that hinder precise measurement of oxygen saturation

Soles and Palm

- pulse oximeter probes that are used on the palm and soles utilize a wrap sensor instead of the ones that are clipped

Forehead

- In more rare cases, wherein the digits and ear are inaccessible, a pulse oximetry reflectance probe may be attached low across the forehead and just right above the eyebrows, making sure that it is placed away from a major vessel.
- **Handheld Oximeter**
