Moving-grid Methods for Time-dependent Partial Differential Equations P. A. Zegeling,1993 **Moving-grid methods for time-dependent partial differential equations** Paul Zegeling,1992 Optimal Moving Grids for Time-Dependent Partial Differential Equations National Aeronautics and Space Administration (NASA),2018-07-09 Various adaptive moving grid techniques for the numerical solution of time dependent partial differential equations were proposed The precise criterion for grid motion varies but most techniques will attempt to give grids on which the solution of the partial differential equation can be well represented Moving grids are investigated on which the solutions of the linear heat conduction and viscous Burgers equation in one space dimension are optimally approximated Precisely the results of numerical calculations of optimal moving grids for piecewise linear finite element approximation of partial differential equation solutions in the least squares norm Wathen A J Unspecified Center NCC2 387 Adaptive-grid Methods for Time-dependent Partial Differential Equations ,1981 This paper contains a survey of recent developments of adaptive grid algorithms for time dependent partial differential equations Two lines of research are discussed One involves the automatic selection of moving grids to follow propagating waves The other is based on stationary grids but uses local mesh refinement in both space and time Advantages and disadvantages of both approaches are discussed The development of adaptive grid schemes shows promise of greatly increasing our ability to solve problems in several spatial dimensions Handbook of Grid Generation Joe F. Thompson,Bharat K. Soni,Nigel P. Weatherill,1998-12-29 Handbook of Grid Generation addresses the use of grids meshes in the numerical solutions of partial differential equations by finite elements finite volume finite differences and boundary elements Four parts divide the chapters structured grids unstructured grids surface definition and adaption quality An introduction to each section provides a roadmap through the material This handbook covers Fundamental concepts and approaches Grid generation process Essential mathematical elements from tensor analysis and differential geometry particularly relevant to curves and surfaces Cells of any shape Cartesian structured curvilinear coordinates unstructured tetrahedra unstructured hexahedra or various combinations Separate grids overlaid on one another communicating data through interpolation Moving boundaries and internal interfaces in the field Resolving gradients and controlling solution error Grid generation codes both commercial and freeware as well as representative and illustrative grid configurations Handbook of Grid Generation contains 37 chapters as well as contributions from more than 100 experts from around the world comprehensively evaluating this expanding field and providing a fundamental orientation for practitioners

Numerical Time-Dependent Partial Differential Equations for Scientists and Engineers Moysey Brio,Gary M. Webb,Aramais R. Zakharian,2010-09-21 It is the first text that in addition to standard convergence theory treats other necessary ingredients for successful numerical simulations of physical systems encountered by every practitioner The book is aimed at users with interests ranging from application modeling to numerical analysis and scientific software development It

is strongly influenced by the authors research in in space physics electrical and optical engineering applied mathematics numerical analysis and professional software development The material is based on a year long graduate course taught at the University of Arizona since 1989 The book covers the first two semesters of a three semester series The second semester is based on a semester long project while the third semester requirement consists of a particular methods course in specific disciplines like computational fluid dynamics finite element method in mechanical engineering computational physics biology chemistry photonics etc The first three chapters focus on basic properties of partial differential equations including analysis of the dispersion relation symmetries particular solutions and instabilities of the PDEs methods of discretization and convergence theory for initial value problems The goal is to progress from observations of simple numerical artifacts like diffusion damping dispersion and anisotropies to their analysis and management technique as it is not always possible to completely eliminate them In the second part of the book we cover topics for which there are only sporadic theoretical results while they are an integral part and often the most important part for successful numerical simulation We adopt a more heuristic and practical approach using numerical methods of investigation and validation The aim is teach students subtle key issues in order to separate physics from numerics The following topics are addressed Implementation of transparent and absorbing boundary conditions Practical stability analysis in the presence of the boundaries and interfaces Treatment of problems with different temporal spatial scales either explicit or implicit preservation of symmetries and additional constraints physical regularization of singularities resolution enhancement using adaptive mesh refinement and moving meshes Self contained presentation of key issues in successful numerical simulation Accessible to scientists and engineers with diverse background Provides analysis of the dispersion relation symmetries particular solutions and instabilities of the partial differential equations

A Moving-grid Interface for Systems of One-dimensional Time-dependent Partial Differential Equations J. G. Blom, P. A. Zegeling, 1989 Abstract In the last decade numerical techniques have been developed to solve time dependent Partial Differential Equations PDEs in one dimension having solutions with steep gradients in space and in time One of these techniques a moving grid method based on a Lagrangian description of the PDE and a smoothed equidistribution principle to define the grid positions at each time level has been coupled to a spatial discretization method which automatically discretized the spatial part of the user defined PDE following the Method of Lines approach
