as a comprehensive knowledgebase on both the fundamentals and applications of this important materials processing method. The diverse international team of contributing authors of this reference clarify in extensive detail properties and applications of sol gel science and technology as it pertains to the production of substances active and non active including optical electronic chemical sensor bio and structural materials. Essential to a wide range of manufacturing industries, the compilation divides into the three complementary sections: Sol Gel Processing devoted to general aspects of processing and recently developed materials such as organic inorganic hybrids, photonic crystals, ferroelectric coatings and photocatalysts; Characterization of Sol Gel Materials and Products presenting contributions that highlight the notion that useful materials are only produced when characterization is tied to processing such as determination of structure by NMR in situ; characterization of the sol gel reaction process, determination of microstructure of oxide gels, characterization of porous structure of gels by the surface measurements and characterization of organic inorganic hybrid and Applications of Sol Gel Technology covering applications such as the sol gel method used in processing of bulk silica glasses, bulk porous gels prepared by sol gel method, application of sol gel method to fabrication of glass and ceramic fibers, reflective and antireflective coating films, application of sol gel method to formation of photocatalytic coating films and application of sol gel method to bioactive coating films. The comprehensive scope and integrated treatment of topics make this reference volume ideal for R D scientists and engineers across a wide range of disciplines and professional interests. [&H2020-MSCA-RISE-2015 CARDIALLY workshop](#) Marina Lekić, Aleksandar Krmpot, 2017-08-28 **Few-Cycle Laser Pulse Generation and Its Applications** Franz X. Kärtner, 2004-09-14. This book covers the physics technology and applications of short pulse laser sources that generate pulses with durations of only a few optical cycles. The basic design considerations for the different systems such as lasers, parametric amplifiers and external compression techniques which have emerged over the last decade are discussed to give researchers and graduate students a thorough introduction to this field. The existence of these sources has opened many new fields of research that were not possible before. These are UV and EUV generation from table top systems using high harmonic generation, frequency metrology enabling optical frequency counting, high resolution optical coherence tomography, strong field ultrafast solid state processes and ultrafast spectroscopy to mention only a few. Many new applications will follow. The book attempts to give a comprehensive while not excessive introduction to this exciting new field that serves both experienced researchers and graduate students entering the field. The first half of the book covers the current physical principles, processes and design guidelines to generate pulses in the optical range comprising only a few cycles of light. Such as the generation of relatively low energy pulses at high repetition rates directly from the laser, parametric generation of medium energy pulses and high energy pulses at low repetition rates using external compression in hollow fibers. The applications cover the revolution in frequency metrology and high resolution laser

spectroscopy to electric field synthesis in the optical range as well as the emerging field of high harmonic generation and attosecond science high resolution optical imaging and novel ultrafast dynamics in semiconductors These fields benefit from the strong electric fields accompanying these pulses in solids and gases during events comprising only a few cycles of light
