Stuber,1977 **Nuclear Science Abstracts** ,1972 **Proceedings** International Centre for Theoretical Physics,1975 *Lectures on the Theory of the Nucleus* A. G. Sitenko,V. K. Tartakovskii,2014-06-28 Provides an advanced and up to date account of the theory of nuclear structure and discusses in considerable detail both the superfluid and collective models of the nucleus in addition to earlier complementary models and theories The book also examines other important topics such as the rotational and vibrational spectra of nuclei which have not previously been treated in such depth To summarize it covers a large amount of theoretical ground in one volume and attempts to fill a serious gap in the literature Many problems are included **The Atomic Nucleus as a Relativistic System** Lev N. Savushkin,Hiroshi Toki,2004-01-20 Relativity plays an important role in atomic nuclei and since the early 1970s there has been increasing interest in and literature on the nucleus as a relativistic system In fact the relativistic treatment provides a powerful method to describe nuclear structure and reactions It is thus an ideal time to collect and review the important landmarks in this book Directed to advanced students and researchers it explains both the underlying relativistic theory and compares predictions with actual experiments Contemporary Models of the Atomic Nucleus P. E. Nemirovskii,2013-10-22 Contemporary Models of the Atomic Nucleus discusses nuclear structure and properties expounding contemporary theoretical concepts of the low energy nuclear processes underlying in nuclear models This book focuses on subjects such as the optical nuclear model unified or collective model and deuteron stripping reaction Other topics discussed include the basic nuclear properties shell model theoretical analysis of the shell model and radiative transitions and alpha decay The deuteron theory and the liquid drop nuclear model with its application to fission theory are also mentioned but only briefly discussed This publication benefits students and researchers conducting work on nuclear physics specifically on the constituents and interactions of the atomic nucleus *An Approximation to the Self Consistent Field Method for the Nuclear Many-body Problem* Sajeev Oommen John,1979 **Scientific and Technical Aerospace Reports** ,1970 **Particles and Nuclei** N. N. Bogolyubov,A. M. Baldin,Nguyen Van Heu,V. G. Solov'ev,2012-12-06 The Model Hamiltonian in Superconductivity Theory The Self consistent Field Method in Nuclear Theory Collective Acceleration of Ions Leptonic Hadron Decays Three Quasiparticle States in Deformed Nuclei with Mass Numbers between 150 and 190 Fundamental Electromagnetic Properties of the Neutron *Mean Field Theory* Vladimir M Kolomietz,Shalom Shlomo,2020-05-08 This book describes recent theoretical and experimental developments in the study of static and dynamic properties of atomic nuclei many body systems of strongly interacting neutrons and protons The theoretical approach is based on the concept of the mean field describing the motion of a nucleon in terms of a self consistent single particle potential well which approximates the interactions of a nucleon with all the other nucleons The theoretical approaches also go beyond the mean field approximation by including the effects of two body collisions The self consistent mean field

approximation is derived using the effective nucleon nucleon Skyrme type interaction The many body problem is described next in terms of the Wigner phase space of the one body density which provides a basis for semi classical approximations and leads to kinetic equations Results of static properties of nuclei and properties associated with small amplitude dynamics are also presented Relaxation processes due to nucleon nucleon collisions are discussed next followed by instability and large amplitude motion of excited nuclei Lastly the book ends with the dynamics of hot nuclei The concepts and methods developed in this book can be used for describing properties of other many body systems *Energy Information Data Base* United

States. Department of Energy. Technical Information Center,1978 **A Review of the Literature Published Between**

June 1996 and May 1997 G. A. Webb,1998 Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research Written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry **Atomic Photoeffect** M.Ya. Amusia,2013-06-29 This book is devoted to the investigation of a rather prevalent

process in nature interaction of atoms with electromagnetic radiation Primary attention is given to the low and intermediate photon energy region from tens to hundreds of electron volts It is in this region that the probability of photon absorption and photoionization is largest Data in this energy region are very interesting and useful in astrophysics and plasma physics solid state physics and quantum electronics and in a number of other branches of science and technical applications Formulae for hydrogen atom photoionization are given in almost all textbooks on quantum mechanics Together with the limited amounts of experimental data available up to the beginning of the sixties the formulae gave an impression of the completeness of the study of photoionization of the absolute clarity of the mechanism of the process and of the possibility of calculating rather easily its probability using the formulae **Quantum Dynamics of Complex Molecular Systems** David A. Micha,Irene

Burghardt,2006-11-22 Quantum phenomena are ubiquitous in complex molecular systems as revealed by many experimental observations based upon ultrafast spectroscopic techniques and yet remain a challenge for theoretical analysis The present volume based on a May 2005 workshop examines and reviews the state of the art in the development of new theoretical and computational methods to interpret the observed phenomena Emphasis is on complex molecular processes involving surfaces clusters solute solvent systems materials and biological systems The research summarized in this book shows that much can be done to explain phenomena in systems excited by light or through atomic interactions It demonstrates how to tackle the multidimensional dynamics arising from the atomic structure of a complex system and addresses phenomena in condensed phases as well as phenomena at surfaces The chapters on new methodological developments cover both phenomena in isolated systems and phenomena which involve the statistical effects of an environment such as fluctuations and dissipation The methodology part explores new rigorous ways to formulate mixed quantum classical dynamics in many dimensions along with new ways to solve a many atom Schroedinger equation or the Liouville von Neumann equation for the density operator

using trajectories and ideas related to hydrodynamics Part I treats applications to complex molecular systems and Part II covers new theoretical and computational methods Dissertations in Physics M.
