

THE THEORY OF PRIME ENDS AND SPATIAL MAPPINGS

DENIS KOVTONYUK AND VLADIMIR RYAZANOV

Abstract

It is given a canonical representation of prime ends in regular spatial domains and, on this basis, it is studied the boundary behavior of the so-called lower Q -homeomorphisms that are the natural generalization of the quasiconformal mappings. In particular, it is found a series of effective conditions on the function $Q(x)$ for a homeomorphic extension of the given mappings by prime ends in domains with regular boundaries. The developed theory is applied, in particular, to mappings of the classes of Sobolev and Orlicz-Sobolev and also to finitely bilipschitz mappings that a far-reaching extension of the well-known classes of isometric and quasiisometric mappings.

1 Introduction

The problem of the boundary behavior is one of the central topics of the theory of quasiconformal mappings and their generalizations. During the last years they intensively studied various classes of mappings with finite distortion in a natural way generalizing conformal, quasiconformal and quasiregular mappings, see many references in the monographs [8] and [20]. In this case, as it was earlier, the main geometric approach in the modern mapping theory is the method of moduli, see, e.g., the monographs [8], [20], [24], [29], [39], [40] and [41].

From the point of view of the theory of conformal mappings, it was unsatisfactory to consider the individual points of the boundary of a simply connected domain as the primitive constituents of the boundary. Indeed, if correspondingly to the Riemann theorem such a domain is mapped conformally onto the
