Recording for the Blind & Dyslexic, ... Catalog of Books ,1996 Mathematical Modeling Mark M. Meerschaert, 2007-06-18 Mathematical Modeling Third Edition is a general introduction to an increasingly crucial topic for today's mathematicians Unlike textbooks focused on one kind of mathematical model this book covers the broad spectrum of modeling problems from optimization to dynamical systems to stochastic processes Mathematical modeling is the link between mathematics and the rest of the world Meerschaert shows how to refine a question phrasing it in precise mathematical terms Then he encourages students to reverse the process translating the mathematical solution back into a comprehensible useful answer to the original question This textbook mirrors the process professionals must follow in solving complex problems Each chapter in this book is followed by a set of challenging exercises These exercises require significant effort on the part of the student as well as a certain amount of creativity Meerschaert did not invent the problems in this book they are real problems not designed to illustrate the use of any particular mathematical technique Meerschaert's emphasis on principles and general techniques offers students the mathematical background they need to model problems in a wide range of disciplines Increased support for instructors including MATLAB material New sections on time series analysis and diffusion models Additional problems with international focus such as whale and dolphin populations plus updated optimization problems **Mathematics of Public Health** V. Kumar Murty, Jianhong Wu, 2022-02-08 Curated by the Fields Institute for Research in Mathematical Sciences from their COVID 19 Math Modelling Seminars this first in a series of volumes on the mathematics of public health allows readers to access the dominant ideas and techniques being used in this area while indicating problems for further research This work brings together experts in mathematical modelling from across Canada and the world presenting the latest modelling methods as they relate to the COVID 19 pandemic A primary

aim of this book is to make the content accessible so that researchers share the core methods that may be applied elsewhere. The mathematical theories and technologies in this book can be used to support decision makers on critical issues such as projecting outbreak trajectories, evaluating public health interventions for infection prevention and control, developing optimal strategies to return to a new normal, and designing vaccine candidates and informing mass immunization programs. Topical coverage includes basic susceptible-exposed-infectious-recovered (SEIR) modelling framework modified and applied to COVID-19 disease transmission dynamics, nearcasting and forecasting for needs of critical medical resources including personal protective equipment (PPE), predicting COVID-19 mortality, evaluating effectiveness of convalescent plasma treatment, and the logistic implementation challenges, estimating impact of delays in contact tracing, quantifying heterogeneity in contact mixing, and its evaluation with social distancing modelling, point-of-care diagnostics of COVID-19, and understanding non-reporting and underestimation. Further, readers will have the opportunity to learn about current modelling methodologies and technologies for emerging infectious disease outbreaks, pandemic mitigation, rapid response, and the mathematics behind them. The volume will help the general audience and experts to better understand the important role that mathematics has been playing during this ongoing crisis in supporting critical decision making by governments and public health agencies.
