

DEVELOPING ASSESSMENT RELIABILITY AND VALIDITY: ITEM ANALYSIS

Readily available analysis techniques allow us to obtain sophisticated item analysis data for music items

Item Response Theory models should become the standard analysis approach

3 parameter models for dichotomous items which measure difficulty and discrimination while controlling for guessing

Polytomous generalized rating scale models extend IRT theory to the analysis of rubric-based assessments (i.e. Samejima's graded response model)

Easy software programs such as XCalibre4™ make these complex calculations accessible

Frank Baker's classic book, *Basics of Item response theory*, is now a free ERIC document

Making Classroom Assessments Reliable and Valid Robert J. Marzano, 2017-07-28 Making Classroom Assessments Reliable and Valid by Robert J Marzano will convince you that classroom assessments should become the primary method for formally measuring student learning over other types of assessment in education Read about the key advantages of classroom assessments over interim end of course and state assessments in how to assess student learning and measure growth over time Marzano also addresses the validity and reliability of classroom assessments and how to improve those metrics before bringing them to their rightful place in K 12 assessments This book outlines how to revamp validity and reliability to match technical advances made in classroom assessment instead of matching large scale assessment s traditional standards Using this book teachers schools and districts can design classroom assessments that are equally if not more reliable and valid than traditional large scale assessments How this book will convince you to use classroom assessments Consider the history of large scale assessments in US education and the purpose of standardized testing Inspect the importance of and future role of classroom assessment Explore the three mathematical models of reliability as well as the three major types of validity Understand the principles of assessment for learning and the importance of measuring students individual and comparative growth Use the provided formulas to create classroom assessments that match traditional interim or end of year assessments in reliability and validity Contents Introduction The Role of Classroom Assessment Chapter 1 Discussing the Classroom Assessment Paradigm for Validity Chapter 2 Designing and Scoring Parallel Assessments Chapter 3 Discussing the Classroom Assessment Paradigm for Reliability Chapter 4 Measuring Growth for Groups of Students Chapter 5 Transforming the System Using the New Classroom Assessment Paradigms Appendix

Validity and Inter-Rater Reliability Testing of Quality Assessment Instruments U. S. Department of Health and Human Services, Agency for Healthcare Research and Quality, 2013-04-09 The internal validity of a study reflects the extent to which the design and conduct of the study have prevented bias es One of the key steps in a systematic review is assessment of a study s internal validity or potential for bias This assessment serves to 1 identify the strengths and limitations of the included studies 2 investigate and potentially explain heterogeneity in findings across different studies included in a systematic review and 3 grade the strength of evidence for a

given question The risk of bias assessment directly informs one of four key domains considered when assessing the strength of evidence With the increase in the number of published systematic reviews and development of systematic review methodology over the past 15 years close attention has been paid to the methods for assessing internal validity Until recently this has been referred to as quality assessment or assessment of methodological quality In this context quality refers to the confidence that the trial design conduct and analysis has minimized or avoided biases in its treatment comparisons To facilitate the assessment of methodological quality a plethora of tools has emerged Some of these tools were developed for specific study designs e g randomized controlled trials RCTs cohort studies case control studies while others were intended to be applied to a range of designs The tools often incorporate characteristics that may be associated with bias however many tools also contain elements related to reporting e g was the study population described and design e g was a sample size calculation performed that are not related to bias The Cochrane Collaboration recently developed a tool to assess the potential risk of bias in RCTs The Risk of Bias ROB tool was developed to address some of the shortcomings of existing quality assessment instruments including over reliance on reporting rather than methods Several systematic reviews have catalogued and critiqued the numerous tools available to assess methodological quality or risk of bias of primary studies In summary few existing tools have undergone extensive inter rater reliability or validity testing Moreover the focus of much of the tool development or testing that has been done has been on criterion or face validity Therefore it is unknown whether or to what extent the summary assessments based on these tools differentiate between studies with biased and unbiased results i e studies that may over or underestimate treatment effects There is a clear need for inter rater reliability testing of different tools in order to enhance consistency in their application and interpretation across different systematic reviews Further validity testing is essential to ensure that the tools being used can identify studies with biased results Finally there is a need to determine inter rater reliability and validity in order to support the uptake and use of individual tools that are recommended by the systematic review community and specifically the ROB tool within the Evidence based Practice Center EPC Program In this project we focused on two tools that are commonly used in systematic reviews The Cochrane ROB tool was designed for RCTs and is the instrument recommended by The Cochrane Collaboration for use in systematic reviews of RCTs The Newcastle Ottawa Scale is commonly used for nonrandomized studies specifically cohort and case control studies
