Mathematical Models of Epidemics

Christopher Lin, Math 89S Spring 2016

Epidemics occur often, and result in both severe human and monetary losses. However mathematical modeling of the spread of infectious diseases can reveal important insights into their behavior, and help scientists and policy makers prevent or reduce their adverse impacts.

What is an Epidemic?

Generally, an epidemic is the spread of a disease to a large number of people over a short period of time. Epidemics are divided into two major types: common source, and propagated outbreaks. Common source outbreaks occur when individuals are exposed to the same toxin or infectious agent. The epidemic of leukemia in Hiroshima following the atomic bomb detonation, or an outbreak of E. coli from a batch of infected vegetables would be examples of epidemics caused by a common source. More relevant to our discussion in this paper, are propagated outbreaks. In a propagated outbreak, disease is spread from person to person, such as in the case of influenza or syphilis. A propagated outbreak can also be spread by other vectors, such as mosquitoes in the case of malaria. When an epidemic spreads to encompass multiple countries or continents, it is often reclassified as a pandemic (Principles of Epidemiology in Public Health Practice).

Epidemics can cause massive human and economic losses. The Spanish Flu epidemic in 1918 caused between 40 and 50 million deaths. Asian influenza in 1957 killed 2 million, and Hong Kong influenza in 1968 resulted in 1 million deaths (What are Epidemics). Every year, in the United States alone, more than 200,000 people are hospitalized due to influenza, and anywhere from 5% to 20% of the population becomes infected. It is estimated that between 3,000 to 49,000 people die from influenza each year (Seasonal Influenza). Economic damage can also be severe: one study estimated that the 2002 SARS outbreak in East Asia resulted in a 2.63% drop in GDP in Hong Kong, and a 1.5% drop in GDP in mainland China (Lee and McKibbin, 2004).

Because epidemics hold possibly dire consequences for entire countries, regions, or continents, it is extremely important for scientists and policy makers to prevent epidemics if possible. However, due to the complex and large-scale nature of epidemics, it is basically impossible to perform non-retrospective studies. Furthermore, any sort of controlled experiment in which a population is infected with a disease would be incredibly unethical. Thus, the best way to study, predict, and experiment with the behavior of epidemics is through mathematical modeling.

Mathematical Modeling

One of the first to develop a mathematical model of disease was the Swiss scientist and mathematician, Daniel Bernoulli, who was best known for his work with the mathematics of fluid mechanics. In 1766, Bernoulli, using a simple compartmental model and census data, was able to show that vaccinating

Mathematical Modeling in Epidemiology James C. Frauenthal,2012-12-06 The text of this book is derived from courses taught by the author in the Department of Applied Mathematics and Statistics at the State University of New York at Stony Brook The audience for these courses was composed almost entirely of fourth year undergraduate students majoring in the mathematical sciences The students had ordinarily completed four semesters of calculus and one of probability Few had any prior experience with differential equations stochastic processes or epidemiology It also seems prudent to mention that the author s background is in engineering and applied mathematics and not in epidemiology it is hoped that this is not painfully obvious The topics covered in this book have in some cases been modified from the way they were originally presented However care has been taken to include a suitable amount of material for a one semester course the temptation to add gratuitous subject matter has been resisted Similarly when a choice between clarity and rigor was available the more easily understood exposition was selected By looking only at the table of contents the casual reader could be easily misled into thinking that the main concern of this book is with epidemiology This is not the case The purpose of this book is to illustrate the process of formulating and solving mathematical models   Mathematical Analysis of Infectious Diseases Praveen Agarwal,Juan J. reader with the general picture and the main ideas of the subject The book introduces the reader to methodological aspects of epidemiology that are specific for infectious diseases and provides insight into the epidemiology of some classes of infectious diseases characterized by their main modes of transmission This choice of topics bridges the gap between scientific research on the clinical biological mathematical social and economic aspects of infectious diseases and their applications in public health The book will help the reader to understand the impact of infectious diseases on modern society and the instruments that policy makers have at their disposal to deal with these challenges It is written for students of the health sciences both of curative medicine and public health and for experts that are active in these and related domains and it may be of interest for the educated layman since the technical level is kept relatively low   **An Introduction to Mathematical Epidemiology** Maia Martcheva,2015-10-20 The book is a comprehensive self contained introduction to the mathematical modeling and analysis of infectious diseases It includes model building fitting to data local and global analysis techniques Various types of deterministic dynamical models are considered ordinary differential equation models delay differential equation models difference equation models age structured PDE models and diffusion models It includes various techniques for the computation of the basic reproduction number as well as approaches to the epidemiological interpretation of the reproduction number MATLAB code is included to facilitate the data fitting and the simulation with age structured models   Mathematical Models for Communicable Diseases Fred Brauer,Carlos Castillo-Chavez,2013-02-07 A self contained and comprehensive guide to the mathematical modeling of disease transmission appropriate for graduate students
