Introduction to Relativistic Quantum Chemistry Kenneth G. Dyall, Knut Faegri Jr., 2007-04-19 This book provides an introduction to the essentials of relativistic effects in quantum chemistry and a reference work that collects all the major developments in this field It is designed for the graduate student and the computational chemist with a good background in nonrelativistic theory In addition to explaining the necessary theory in detail at a level that the non expert and the student should readily be able to follow the book discusses the implementation of the theory and practicalities of its use in calculations After a brief introduction to classical relativity and electromagnetism the Dirac equation is presented and its symmetry atomic solutions and interpretation are explored Four component molecular methods are then developed self consistent field theory and the use of basis sets double group and time reversal symmetry correlation methods molecular properties and an overview of relativistic density functional theory The emphases in this section are on the basics of relativistic theory and how relativistic theory differs from nonrelativistic theory Approximate methods are treated next starting with spin separation in the Dirac equation and proceeding to the Foldy Wouthuysen Douglas Kroll and related transformations Breit Pauli and direct perturbation theory regular approximations matrix approximations and pseudopotential and model potential methods For each of these approximations one electron operators and many electron methods are developed spin free and spin orbit operators are presented and the calculation of electric and magnetic properties is discussed The treatment of spin orbit effects with correlation rounds off the presentation of approximate methods The book concludes with a discussion of the qualitative changes in the picture of structure and bonding that arise from the inclusion of relativity

The Effects of Relativity in Atoms, Molecules, and the Solid State Stephen Wilson, I.P. Grant, B.L. Gyorffy, 2012-12-06 Recent years have seen a growing interest in the effects of relativity in atoms molecules and solids On the one hand this can be seen as result of the growing awareness of the importance of relativity in describing the properties of heavy atoms and systems containing them This has been fueled by the

inadequacy of physical models which either neglect relativity or which treat it as a small perturbation On the other hand it is dependent upon the technological developments which have resulted in computers powerful enough to make calculations on heavy atoms and on systems containing heavy atoms meaningful Vector processing and more recently parallel processing techniques are playing an increasingly vital role in rendering the algorithms which arise in relativistic studies tractable This has been exemplified in atomic structure theory where the dominant role of the central nuclear charge simplifies the problem enough to permit some prediction to be made with high precision especially for the highly ionized atoms of importance in plasma physics and in laser confinement studies Today's sophisticated physical models of the atom derived from quantum electrodynamics would be intractable without recourse to modern computational machinery Relativistic atomic structure calculations have a history dating from the early attempts of Swirls in the mid 1930's but continue to provide one of the primary test beds of modern theoretical physics
