S. Artemiev, T. A. Averina, 2011-02-11 No detailed description available for Numerical Analysis of Systems of Ordinary and Stochastic Differential Equations Numerical Methods for Controlled Stochastic Delay Systems Harold Kushner, 2008-12-19 The Markov chain approximation methods are widely used for the numerical solution of nonlinear stochastic control problems in continuous time This book extends the methods to stochastic systems with delays The book is the first on the subject and will be of great interest to all those who work with stochastic delay equations and whose main interest is either in the use of the algorithms or in the mathematics An excellent resource for graduate students researchers and practitioners the work may be used as a graduate level textbook for a special topics course or seminar on numerical methods in stochastic control

Numerical Methods for Stochastic Control Problems in Continuous Time Harold Kushner,Paul G. Dupuis,2012-12-06 This book is concerned with numerical methods for stochastic control and optimal stochastic control problems The random process models of the controlled or uncontrolled stochastic systems are either diffusions or jump diffusions Stochastic control is a very active area of research and new problem formulations and sometimes surprising applications appear regularly We have chosen forms of the models which cover the great bulk of the formulations of the continuous time stochastic control problems which have appeared to date The standard formats are covered but much emphasis is given to the newer and less well known formulations The controlled process might be either stopped or absorbed on leaving a constraint set or upon first hitting a target set or it might be reflected or projected from the boundary of a constraining set In some of the more recent applications of the reflecting boundary problem for example the so called heavy traffic approximation problems the directions of reflection are actually discontinuous In general the control might be representable as a bounded function or it might be of the so called impulsive or singular control types Both the drift and the variance might be controlled The cost functions might be any of the standard types Discounted stopped on first exit from a set finite time optimal stopping average cost per unit time over the infinite time interval and so forth

Control and Dynamic Systems V55: Digital and Numeric Techniques and Their Application in Control Systems

C.T. Leonides, 2012-12-02 Control and Dynamic Systems Advances in Theory Applications Volume 55 Digital and Numeric Techniques and their Applications in Control Systems Part 1 of 2 covers advances in numerical and computational techniques for the design of modern complex control systems This book presents a comprehensive treatment of the many issues that are dealt with in modern complex systems It discusses the efficacy of significant techniques for robust control design model reduction adaptive estimation of discrete time stochastic systems parameter estimation and loop transfer recovery Students research workers and practising engineers will find this book invaluable *Hybrid Stochastic Systems* Tuan A. Hoang, 2017 This dissertation is concerned with the so called stochastic hybrid systems which are featured by the coexistence of continuous dynamics and discrete events and their interactions Such systems have drawn much needed attentions in recent years One of the main reasons is that such systems can be used to better reflect the reality for a wide range of applications in networked systems communication systems economic systems cyber physical systems and biological and ecological systems among others Our main interest is centered around one class of such hybrid systems known as switching diffusions In such a system in addition to the driving force of a Brownian motion as in a stochastic system represented by a stochastic differential equation SDE there is an additional continuous time switching process that models the environmental changes due to random events In the first part we develops numerical schemes for stochastic differential equations with Markovian switching Markovian switching SDEs By utilizing a special form of It o's formula for switching SDEs and special structural of the jumps of the switching component we derived a new scheme to simulate switching SDEs in the spirit of Milstein s scheme for purely SDEs We also develop a new approach to establish the convergence of the proposed algorithm that incorporates martingale methods quadratic variations and Markovian stopping times Detailed and delicate analysis is carried out Under suitable conditions which are natural extensions of the classical ones the convergence of the algorithms is established The rate of convergence is also ascertained The second part is concerned with a limit theorem for general stochastic differential equations with Markovian regime switching Given a sequence of stochastic regime switching systems where the discrete switching processes are independent of the state of the systems In the first part we develops numerical schemes for stochastic differential equations with Markovian switching Markovian switching SDEs By utilizing a special form of Ito's formula for switching SDEs and special structural of the jumps of the switching component we derived a new scheme to simulate switching SDEs in the spirit of Milstein s scheme for purely SDEs We also develop a new approach to establish the convergence of the proposed algorithm that incorporates martingale methods quadratic variations and Markovian stopping times Detailed and delicate analysis is carried out Under suitable conditions which are natural extensions of the classical ones the convergence of the algorithms is established The rate of convergence is also ascertained The second part is concerned with a limit theorem for general stochastic differential equations with Markovian regime switching Given a sequence of stochastic regime switching systems where the discrete switching processes are independent of the state of the

systems The continuous state component of these systems are governed by stochastic differential equations with driving processes that are continuous increasing processes and square integrable martingales We establish the convergence of the sequence of systems to the one described by a state independent regime switching diffusion process when the two driving processes converge to the usual time process and the Brownian motion in suitable sense The third part is concerned with controlled hybrid systems that are good approximations to controlled switching diffusion processes In lieu of a Brownian motion noise we use a wide band noise formulation which facilitates the treatment of non Markovian models The wide band noise is one whose spectrum has band width wide enough We work with a basic stationary mixing type process On top of this wide band noise process we allow the system to be subject to random discrete event influence The discrete event process is a continuous time Markov chain with a finite state space Although the state space is finite we assume that the state space is rather large and the Markov chain is irreducible Using a two time scale formulation and assuming the Markov chain also subjects to fast variations using weak convergence and singular perturbation test function method we first proved that the when controlled by nearly optimal and equilibrium controls the state and the corresponding costs of the original systems would converge to those of controlled diffusions systems Using the limit controlled dynamic system as a guidance we construct controls for the original problem and show that the controls so constructed are near optimal and nearly equilibrium
