Numerical Modelling and Geomechanics (soil - Rock - Concrete) O. C. Zienkiewicz, University College of Swansea. Institute for Numerical Methods in Engineering, 1983

Distinct Element Modelling in Geomechanics K.R. Saxena, 2018-12-20 Linear mathematical assumptions for procedures in other branches of engineering have little relevance for geoenvironmental engineering which must accommodate non linear behaviors Contributors to eight papers apply the breakthrough numerical modeling Distinct Element Method Cundall late 1960s The design philosophy for structures or excavations in geotechnical engineering is different from that followed for fabricated materials like steel and concrete The designer has little data both with regard to geological weaknesses and strength and deformation characteristics of materials before finalizing the designs Also these characteristics vary from place to place In situ stresses due to gravity and tectonics and transient forces imposed due to rainfall and earthquakes make the matter more complicated The pore waters carry the load initially before passing it on to the solids For the analytical

procedure to be realistic it should account for large displacements and non linear behaviour including strain softening. Because of these considerations the designers have followed procedures based on simplifying assumptions such as linear small strain elastoplastic behaviour. Numerical procedures based on such assumptions though very popular in other branches of engineering have made little impact in geo engineering. An attempt has been made in this book to compile the recent use of distinct element codes for solutions of some of the problems in geomechanics particularly those involving excavations. It is hoped that it will provide an opportunity for the fraternity of geotechnical engineers to appreciate the opening of new frontiers in the use of computers for solving more challenging geotechnical problems.

Notes on Numerical Modeling in Geomechanics William G. Pariseau, 2022-03-30

This book is an introduction to numerical analysis in geomechanics and is intended for advanced undergraduate and beginning graduate study of the mechanics of porous jointed rocks and soils. Although familiarity with the concepts of stress strain and so on is assumed a review of the fundamentals of solid mechanics including concepts of physical laws kinematics and material laws is presented in an appendix. Emphasis is on the popular finite element method but brief explanations of the boundary element method the distinct element method also known as the discrete element method and discontinuous deformation analysis are included. Familiarity with a computer programming language such as Fortran C or Python is not required although programming excerpts in Fortran are presented at the end of some chapters. This work begins with an intuitive approach to interpolation over a triangular element and thus avoids making the simple complex by not doing energy minimization via a calculus of variations approach so often found in reference books on the finite element method. The presentation then proceeds to a principle of virtual work via the well known divergence theorem to obtain element equilibrium and then global equilibrium both expressed as stiffness equations relating force to displacement. Solution methods for the finite element approach including elimination and iteration methods are discussed. Hydro mechanical coupling is described and extension of the finite element method to accommodate fluid flow in porous geological media is made. Example problems illustrate important concepts throughout the text. Additional problems for a 15 week course of study are presented in an appendix. Solutions are given in another appendix.

Modelling of Construction Processes in Geotechnical Engineering for Urban Environment Theodoros Triantafyllidis, 2006-02-23

It has become increasingly important particularly in an urban environment to predict soil behaviour and to confine the settlement or deformation of buildings adjacent to construction sites. One important factor is the choice of construction procedure for the installation of piles sheet pile walls anchors or for soil improvement techniques ground freezing and tunnelling methods. The modelling of construction processes which are frequently associated with large deformations of the soil and with strong changes in the structure of the soil around the construction plant in the case of for example a drill a bit a vibrator or an excavation tool requires sophisticated and new methods in numerical modelling. Often

the simulation of the construction procedure is neglected in the calculations Such methods are described and discussed in this book as are examples of the methods applied to geotechnical practice field and laboratory testing as well as case studies This volume provides a valuable source of reference for scientists in geotechnical engineering and numerical modelling geotechnical engineers post graduate students construction companies and consultants manufacturers of geotechnical construction plants and software suppliers and developers of geotechnical construction methods Numerical Methods and Constitutive Modelling in Geomechanics Chandrakant S. Desai, Giancarlo Gioda, 1990-10-22 The solution of stress analysis problems through numerical computer oriented techniques is becoming more and more popular in soil and rock engineering This is due to the ability of these methods to handle geometrically complex problems even in the presence of highly nonlinear material behaviour characterizing the majority of soils and rocks and of media consisting of two or more phases like saturated and partially saturated soils Aim of this book is to present to researchers and engineers working in the various branches of geomechanics an updated state of the research on the development and application of numerical methods in geotechnical and foundation engineering Particular attention is devoted to the formulation of nonlinear material models and to their use for the analysis of complex engineering problems In addition to the constitutive modelling other topics discussed concern the use of the finite element and boundary element methods in geomechanics the dynamic analysis of inelastic and saturated soils the solution of seepage consolidation and coupled problems the analysis of soil structure interaction problems the numerical procedures for the interpretation of field measurements the analysis of tunnels and underground openings
