Scanning Probe Lithography:

Scanning Probe Lithography Hyongsok T. Soh,Kathryn Wilder Guarini,Calvin F. Quate,2001-06-30 Scanning Probe Lithography SPL describes recent advances in the field of scanning probe lithography a high resolution patterning technique that uses a sharp tip in close proximity to a sample to pattern nanometer scale features on the sample SPL is capable of patterning sub 30nm features with nanometer scale alignment registration It is a relatively simple inexpensive reliable method for patterning nanometer scale features on various substrates It has potential applications for nanometer scale research for maskless semiconductor lithography and for photomask patterning The authors of this book have been key players in this exciting new field Calvin Quate has been involved since the beginning in the early 1980s and leads the research time that is regarded as the foremost group in this field Hyongsok Tom Soh and Kathryn Wilder Guarini have been the members of this group who in the last few years have brought about remarkable series of advances in SPM lithography Some of these advances have been in the control of the tip which has allowed the scanning speed to be increased from mum second to mm second Both non contact and in contact writing have been demonstrated as has controlled writing of sub 100 nm lines over large steps on the substrate surface The engineering of a custom designed MOSFET built into each microcantilever for individual current control is another notable achievement Micromachined arrays of probes each with individual control have been demonstrated One of the most intriguing new aspects is the use of directly grown carbon nanotubes as robust high resolution emitters In this book the authors concisely and authoritatively describe the historical context the relevant inventions and the prospects for eventual manufacturing use of this exciting new technology

opened the door even wider when he was able to image biological objects in aqueous environments At this point the sluice gates were opened and a multitude of different instruments appeared There are significant differences between the Scanning Probe Microscopes or SPM and others such as the Scanning Electron Microscope or SEM The probe microscopes do not require preparation of the sample and they operate in ambient atmosphere whereas the SEM must operate in a vacuum environment and the sample must be cross sectioned to expose the proper surface However the SEM can record 3D image and movies features that are not available with the scanning probes

Scanning Probe Lithography. 4. Effect of Scanning Tunneling Microscope Tip Parameters on Lithographic Patterns in Self-Assembling Monolayers ,1996 Here we examine the effect of an STM tip on a Au confined n octadecyl mercaptan HS CH₂ 17CH₃ SAM in air We have determined that STM induced lithography is controlled by a complex combination of parameters defined by both the instrument and the chemical and physical properties of materials in the vicinity of the tip We have identified conditions that permit accurate control of the tip position during patterning so we are able to prevent large tip excursions that lead to mixed patterning mechanisms We propose a multi step model in which the n octadecyl mercaptan monolayer is 1 disrupted by the tip 2 electrochemically desorbed and 3 removed by the scanning action of the tip Once the passivating SAM is removed additional patterning etches the exposed Au substrate In addition to the primary pattern we observe an irregularly shaped region of the surface that is disordered for 1 500 nm beyond the primary pattern This disordered region represents an early stage of the patterning and indicates that the resolution of this technique is limited by the electrochemical nature of the patterning process In some cases it is possible to form secondary patterns from protrusions on the tip Patterns on n octadecyl
