Single-Cell Mutation Monitoring Systems: Methodologies and Applications (Volume 2). AA Ansari (Ed),1984

Single-Cell Mutation Monitoring Systems Aftab A. Ansari,2012-12-06 There is general agreement that increased environmental pollution poses a potential health hazard to humans and that effective control of such genetic injury requires monitoring the exposed individuals for genetic damage and identifying chemicals that may cause mutation or cancer Tests available for identifying mutagens or carcinogens range from relatively simple rapid assays in prokaryotes and test systems utilizing mammalian cells in tissue culture to highly elaborate tests in intact animals No single test can provide data for an unequivocal assessment of the mutagenicity of a given chemical and the risk it might pose to human health A tier approach therefore was suggested for mutagenicity testing in which the suspected agents would be initially evaluated with simple inexpensive tests that would give qualitative results Chemicals found to be positive in the first tier testing would then be evaluated with more complex tests including those based on mammalian cells in culture Testing in the final tier requires whole animal studies and is expensive and time consuming and even the results from these studies need to be extrapolated for human risk assessment The mutation systems based on whole animals require scoring large numbers of animals and therefore are not practical for the routine testing of mutagens As an alternative to monitoring the pedigree cells from exposed individuals may be considered for screening for point mutations through the use of an appropriate marker protein

Genotoxicology of N-Nitroso Compounds T.

Rao,2013-11-11 Topics in Chemical Mutagenesis is a new series dedicated to studies in the areas of environmental chemical mutagenesis and genetic toxicology In this series we will explore some of many topics that are emerging in these rapidly developing fields The purpose of the present volume is to attempt to organize and compare the genotoxic properties of the N

nitroso compounds This is a particularly interesting class of compounds because of the problems encountered with the Salmonella assay of Ames in generating both false positive and false negative results The battery approach using a number of assay systems seems more appropriate to evaluate chemicals in this class Topics to be discussed in other volumes in this series include single cell mutation monitoring systems the detection of genetic damage in mammalian germ cells the mutagenicity of pesticides problems in monitoring human populations in genetic toxicology and a glossary of terms in genetic toxicology All of these books are in various stages of development and should appear within the next few years Frederick J de Serres Series Editor vii Preface During the past ten years there has been an explosive development in the number of short term tests to predict the biological risks especially risks of cancer in exposure to xenobiotic chemicals The number of published articles in this area has reached many thousands a year and there are several new journals devoted almost entirely to the presentation of the results obtained in these tests *Biomarkers* Robert J Huggett, 2018-01-18 This book provides a survey of biochemical physiological and histological biomarkers of environmental stress along with evaluations of the strengths and weaknesses of various techniques for different applications It features in depth coverage of such topics as DNA adducts acetylcholinesterase ATP endocrine mechanisms blood chemistry histopathological biomarkers stress proteins foreign and endogenous metabolites metallothioneins to name only a few The book will be especially useful to toxicologists biochemists histologists immunologists risk analysis specialists environmental managers regulators environmental scientists and engineers Technologies for detecting heritable mutations in human beings. , 1986
