Mathematical Modelling and Simulation of Electrical Circuits and Semiconductor Devices Randolph Bank, R. Bulirsch, H. Gajewski, K. Merten, 2012-12-06 Progress in today's high technology industries is strongly associated with the development of new mathematical tools. A typical illustration of this partnership is the mathematical modelling and numerical simulation of electric circuits and semiconductor devices. At the second Oberwolfach conference devoted to this important and timely field, scientists from around the world, mainly applied mathematicians and electrical engineers from industry and universities, presented their new results. Their contributions forming the body of this work cover electric circuit simulation, device simulation and process simulation. Discussions on experiences with standard software packages and improvements of such packages are included. In the semiconductor area, special lectures were given on new modelling approaches, numerical techniques and existence and uniqueness results. In this connection, mention is made for example of mixed finite element methods, an extension of the Baliga-Patankar technique for a three-dimensional simulation and the connection between semiconductor equations and the Boltzmann equations.

Stability Theory Rolf Jeltsch, Mohamed Mansour, 2012-12-06 This book contains the historical development of the seminal paper of Adolf Hurwitz, professor in mathematics at ETH, 1892-1919, and its impact on other fields. The major emphasis, however, is on modern results in stability theory and its application in the theory of control and numerics. In particular, stability of the following problems is treated: linear, nonlinear and time-dependent systems; discretizations of ordinary and partial differential equations; systems with time delay; on multidimensional systems. In addition, robust stability, pole placement and problems related to the stability radius are treated. The book is an outgrowth of the international conference Centennial Hurwitz on Stability Theory, which was held to honor Adolf Hurwitz, whose article on the location of roots of a polynomial was published one hundred years ago. The conference took place at the Centro Stefano Franscini, Monte Verita, Ascona, Switzerland, on May 21-26, 1995. This book contains a collection of the papers and open problems discussed on that occasion. Leading researchers from all over the world, working on stability theory and its application, were invited to present their recent results. In one paper, the historic development initiated by Hurwitz's article was discussed.

Transport Simulation in Microelectronics Alfred Kersch, William J. Morokoff, 2012-12-06 Computer simulation of semiconductor processing equipment and devices requires the use of a wide variety of numerical methods. Of these methods, the Monte Carlo approach is perhaps most fundamentally suited to modeling physical events occurring on microscopic scales, which are intricately connected to the particle structure of nature. Here, physical phenomena can be simulated by following simulation particles such as electrons, molecules, photons, etc. through a statistical sampling of

scattering events Monte Carlo is however generally looked on as a last resort due to the extremely slow convergence of these methods It is of interest then to examine when in microelectronics it is necessary to use Monte Carlo methods how such methods may be improved and what are the alternatives This book addresses three general areas of simulation which frequently arise in semiconductor modeling where Monte Carlo methods play a significant role In the first chapter the basic mathematical theory of the Boltzmann equation for particle transport is presented The following chapters are devoted to the modeling of the transport processes and the associated Monte Carlo methods Specific examples of industrial applications illustrate the effectiveness and importance of these methods Two of these areas concern simulation of physical particles which may be assigned a time dependent position and velocity This includes the molecules of a dilute gas used in such processing equipment as chemical vapor decomposition reactors and sputtering reactors We also consider charged particles moving within a semiconductor lattice

Flow in Porous Media J. Douglas, U. Hornung, 2012-12-06 Jim Douglas Jr These proceedings reflect some of the thoughts expressed at the Oberwolfach Conference on Porous Media held June 21-27 1992 organized by Jim Douglas Jr Ulrich Hornung and Cornelius J van Duijn Forty five scientists attended the conference and about thirty papers were presented Fourteen manuscripts were submitted for the proceedings and are incorporated in this volume they cover a number of aspects of flow and transport in porous media Indeed there are 223 individual references in the fourteen papers but fewer than fifteen are cited in more than one paper The papers appear in alphabetical order on the basis of the first author A brief introduction to each paper is given below Allen and Curran consider a variety of questions related to the simulation of ground water contamination Accurate water velocities are essential for acceptable results and the authors apply mixed finite elements to the pressure equation to obtain these velocities Since fine grids are required to resolve heterogeneities standard iterative procedures are too slow for practical simulation the authors introduce a parallelizable multigrid based iterative scheme for the lowest order Raviart Thomas mixed method Contaminant transport is approximated through a finite element collocation procedure and an alternating direction modified method of characteristics technique is employed to time step the simulation Computational experiments carried out on an nCube 2 computer

Everitt, Laszlo Losonczi, Wolfgang Walter, 2012-12-06 Inequalities continue to play an essential role in mathematics The subject is perhaps the last field that is comprehended and used by mathematicians working in all the areas of the discipline of mathematics Since the seminal work Inequalities 1934 of Hardy Littlewood and Pólya mathematicians have laboured to extend and sharpen the earlier classical inequalities New inequalities are discovered every year some for their intrinsic interest whilst others flow from results obtained in various branches of mathematics So extensive are these developments

that a new mathematical periodical devoted exclusively to inequalities will soon appear this is the Journal of Inequalities and Applications to be edited by R P Agarwal Nowadays it is difficult to follow all these developments and because of lack of communication between different groups of specialists many results are often rediscovered several times Surveys of the present state of the art are therefore indispensable not only to mathematicians but to the scientific community at large The study of inequalities reflects the many and various aspects of mathematics There is on the one hand the systematic search for the basic principles and the study of inequalities for their own sake On the other hand the subject is a source of ingenious ideas and methods that give rise to seemingly elementary but nevertheless serious and challenging problems There are many applications in a wide variety of fields from mathematical physics to biology and economics

Inequalities And Applications Ravi P Agarwal, 1994-07-15 World Scientific Series in Applicable Analysis WSSIAA reports new developments of a high mathematical standard and of current interest Each volume in the series is devoted to mathematical analysis that has been applied or is potentially applicable to the solution of scientific engineering and social problems The third volume of WSSIAA contains 47 research articles on inequalities by leading mathematicians from all over the world and a tribute by R M Redheffer to Wolfgang Walter to whom this volume is dedicated on his 66th birthday Contributors A Acker J D Aczél A Alvino K A Ames Y Avishai C Bandle B M Brown R C Brown D Brydak P S Bullen K Deimling J Diaz Elbert P W Elie L H Erbe H Esser M Essén W D Evans W N Everitt V Ferone A M Fink R Ger R Girgensohn P Goetgheluck W Haussmann S Heikkilä J Henderson G Herzog D B Hinton T Horiuchi S Hu B Kawohl V G Kirby N Kirchhoff G H Knightly H W Knobloch Q Kong H K nig A Kufner M K Kwong A Laforgia V Lakshmikantham S Leela R Lemmert E R Love G L ttgens S Malek R Mansevich J Mawhin R Medina M Migda R J Nessel Z P les N S Papageorgiou L E Payne J Peñari L E Persson A Peterson M Pinto M Plum J Popenda G Porru R M Redheffer A A Sagle S Saitoh D Sather K Schmitt D F Shea A Simon S Sivasundaram R Sperb C S Stanton G Talenti G Trombetti S Varoianec A S Vatsala P Volkmann H Wang V Weckesser F Zanolin K Zeller A Zettl

Numerical Methods in Approximation Theory, Vol. 9 D. Braess, L.L. Schumaker, 2013-03-11 This book is the official proceedings of a conference on Numerical Methods in Approximation Theory which was held at the Mathematisches

Forschungsinstitut in Oberwolfach during the week of November 24-30, 1991. It contains refereed and edited papers by 20 of the 49 participants. The book is dedicated to the memory of Prof. Lothar Collatz, who maintained a long and active interest in numerical approximation. It is the ninth in a series of volumes published by Birkhäuser resulting from conferences on the subject held at Oberwolfach and co-organized by Prof. Collatz. We now briefly describe the contents of the book. The paper of BASZEN, SKI, DELVOS and JESTER deals with blending using sine double series expansions of functions defined on the unit square. In addition to giving explicit error estimates for partial sums and for interpolating sine polynomials, they also show that Boolean sums yield almost the same asymptotic error estimates as the conventional tensor product approach but with a reduced number of terms. The paper of BEATSON and LIGHT discusses approximation by quasi-interpolants which are sums of scaled translates of a one-parameter family of functions. They do not require reproduction of low-degree polynomials but nevertheless are able to give error bounds and analyze quasi-interpolation based on Gaussians and exponentials. BINEV and JETTER deal with multivariate interpolation using shifts of a single basis function. They treat both gridded data and scattered data. As examples, they consider box splines and certain radial basis functions.

Topics in Industrial Mathematics H. Neunzert, Abul Hasan Siddiqi, 2013-06-29. Industrial Mathematics is a relatively recent discipline. It is concerned primarily with transforming technical, organizational, and economic problems posed by industry into mathematical problems, solving these problems by approximative methods of analytical and/or numerical nature, and finally reinterpreting the results in terms of the original problems. In short, industrial mathematics is modelling and scientific computing of industrial problems. Industrial mathematicians are bridge builders; they build bridges from the field of mathematics to the practical world, so that they need to know about both sides: the problems from the companies and ideas and methods from mathematics. As

mathematicians they have to be generalists If you enter the world of industry you never know which kind of problems you will encounter and which kind of mathematical concepts and methods you will need to solve them Hence to be a good industrial mathematician you need to know a good deal of mathematics as well as ideas already common in engineering and modern mathematics with tremendous potential for application Mathematical concepts like wavelets pseudorandom numbers inverse problems multigrid etc introduced during the last 20 years have recently started entering the world of real applications Industrial mathematics consists of modelling discretization analysis and visualization To make a good model to transform the industrial problem into a mathematical one such that you can trust the prediction of the model is no easy task
