Physical Fitness/sports Medicine, 1990 **Weight Control and Physical Activity** Harri Vainio, Franca Bianchini, 2002 Avoiding overweight and obesity is the best established diet related risk factor for cancer The proportion of people who are overweight obese is increasing and the amount of physical activity is decreasing in most populations including urban populations in many developing countries The increasing prevalence of overweight obesity is presumably due to the increasing availability of highly palatable high energy foods and an increasing sedentary lifestyle due to mechanisation of both workplace and leisure activities Overweight obesity and reduced physical activity increases the risk of

cancers in various organs Maintaining a healthy body weight and regular physical activity is the second most important way to prevent cancer after tobacco control The suggestions of possible public health actions to tackle these risk factors include the promotion of balanced diets which are not excessive in energy and broad education and planning to enable and encourage physical activity during work and leisure Recommendations and a full discussion of these topics are included in the sixth volume in this series of Handbooks The Journal of Physical Education ,1962 *Research Awards Index* ,1987
