Satellite Remote Sensing and the Management of Natural Resources Nathalie Pettorelli, 2019-05-16 The ability to

anticipate the impacts of global environmental changes on natural resources is fundamental to designing appropriate and optimised adaptation and mitigation strategies. However, this requires the scientific community to have access to reliable large scale information on spatio temporal changes in the distribution of abiotic conditions and on the distribution structure composition and functioning of ecosystems. Satellite remote sensing can provide access to some of this fundamental data by offering repeatable standardised and verifiable information that is directly relevant to the monitoring and management of our natural capital. This book demonstrates how ecological knowledge and satellite based information can be effectively combined to address a wide array of current natural resource management needs. By focusing on concrete applied examples in both the marine and terrestrial realms it will help pave the way for developing enhanced levels of collaboration between the ecological and remote sensing communities as well as shaping their future research directions. *Satellite Remote Sensing and the Management of Natural Resources* is primarily aimed at ecologists and remote sensing specialists as well as policy makers and practitioners in the fields of conservation biology biodiversity monitoring and natural resource management.

Sections on remote sensing applications geographic information system GIS site characterization and standards detail the latest findings in areas such as digital elevation data Landsat T Earth Observation Systems for Resource Management and Environmental Control. D. Clough, 2013-03-09. The NATO Science Committee and its subsidiary Programme Panels provide support for Advanced Research Institutes ARI in various fields. The idea is to bring together scientists of a chosen field with the hope that they will achieve a consensus on research directions for the future and make recommendations for the benefit of a wider scientific community. Attendance is therefore limited to those whose experience and expertise make the conclusions significant and acceptable to the wider community. Participants are selected on the basis of substantial track records in research or in the synthesis of research results to serve mankind. The proposal for a one week ARI on Earth Observation and Information Systems was initiated by the NATO Special Programme Panel on Systems Science SPPOSS. In approving the ARI the senior NATO Science Committee identified the subject as one of universal importance requiring a broad perspective on the development of operational systems based on successful experimental systems. The general purpose of this ARI was to address the critical problems of integrating the relatively new science and technology of remote sensing into operational earth observation and management information systems. The main problems of concern were those related to systems design organization development of infrastructure and use of information in decision processes. The main emphasis was on problems of transferring technologies and methods from experimental to operational systems.
