

Since confined masonry buildings performed well in past earthquakes, resources related to seismic repair and retrofit of these buildings are limited. The reader is referred to a publication developed after the 2009 Pisco, Peru earthquake (PNUD, 2009), and another one prepared after the 2002 Colima, Mexico earthquake (EERI, 2006).

1.3.2 General System Behavior

1.3.2.1 How Seismic Forces are Resisted by a Confined Masonry Wall Panel

Seismic behavior of a confined masonry wall panel can be explained by composite (monolithic) action of a masonry wall and adjacent RC confining elements. This composite action exists due to the tootling between the walls and the tie-columns - that is one of the key features of confined masonry construction. In the absence of tootling, composite action can be achieved by means of horizontal reinforcement (dowels). Figure 5 shows a two-bay confined masonry specimen subjected to reversed cyclic lateral loading simulating earthquake effects (Pérez-Gavián, 2009). The specimen demonstrated a typical damage pattern in the form of diagonal shear cracks. The failure took place in the form of a single diagonal crack which propagated through the walls and the tie-columns. This mechanism can be expected to occur in buildings with small RC tie-column sizes, where tie-column depth does not exceed 1.5 times the wall thickness.

Earthquake Engineering in Europe Mihail Garevski,Atilla Ansal,2010-08-05 This book contains 9 invited keynote and 12 theme lectures presented at the 14th European Conference on Earthquake Engineering 14ECEE held in Ohrid Republic of Macedonia from August 30 to September 3 2010 The conference was organized by the Macedonian Association for Earthquake Engineering MAEE under the auspices of European Association for Earthquake Engineering EAE The book is organized in twenty one state of the art papers written by carefully selected very eminent researchers mainly from Europe but also from USA and Japan The contributions provide a very comprehensive collection of topics on earthquake engineering as well as interdisciplinary subjects such as engineering seismology and seismic risk assessment and management Engineering seismology geotechnical earthquake engineering seismic performance of buildings earthquake resistant engineering structures new techniques and technologies and managing risk in seismic regions are all among the different topics covered in this book The book also includes the First Ambraseys Distinguished Award Lecture given by Prof Theo P Tassios in the honor of Prof Nicholas N Ambraseys The aim is to present the current state of knowledge and engineering practice addressing recent and ongoing developments while also projecting innovative ideas for future research and development It is not always possible to have so many selected manuscripts within the broad spectrum of earthquake engineering thus the book is unique in one sense and may serve as a good reference book for researchers in this field Audience This book will be of interest to civil engineers in the fields of geotechnical and structural earthquake engineering scientists and researchers in the fields of seismology geology and geophysics Not only scientists engineers and students but also those interested in earthquake hazard assessment and mitigation will find in this book the most recent advances

Role of Seismic Testing Facilities in Performance-Based Earthquake Engineering Michael N. Fardis,Zoran T. Rakicevic,2011-10-07 Nowadays research in earthquake engineering is mainly experimental and in large scale advanced computations are integrated with large scale experiments to complement them and extend their scope even by coupling two different but simultaneous tests Earthquake engineering cannot give answers by testing and qualifying few small typical components or single large prototypes Besides the large diversity of Civil Engineering structures does not allow drawing conclusions from only a few tests structures are large and their seismic response and performance cannot be meaningfully tested in an ordinary lab or in the field So seismic testing facilities should be much larger than in other scientific fields their staff has to be resourceful devising intelligent ways to carry out simultaneously different tests and advanced computations To better serve such a mission European testing facilities and researchers in earthquake engineering have shared their resources and activities in the framework of the European project SERIES combining their research and jointly developing advanced testing and instrumentation techniques that maximize testing capabilities and increase the value of the tests This volume presents the first outcomes of the SERIES and its contribution towards Performance based Earthquake Engineering i

e to the most important development in Earthquake Engineering of the past three decades The concept and the methodologies for performance based earthquake engineering have now matured However they are based mainly on analytical numerical research large scale seismic testing has entered the stage recently The SERIES Workshop in Ohrid MK in Sept 2010 pooled together the largest European seismic testing facilities Europe s best experts in experimental earthquake engineering and select experts from the USA to present recent research achievements and to address future developments Audience This volume will be of interest to researchers and advanced practitioners in structural earthquake engineering geotechnical earthquake engineering engineering seismology and experimental dynamics including seismic qualification
