Natural Language Generation in Artificial Intelligence and Computational Linguistics

Cecile L. Paris,William R. Swartout,William C. Mann,2013-03-14 One of the aims of Natural Language Processing is to facilitate the use of computers by allowing their users to communicate in natural language There are two important aspects to person machine communication understanding and generating While natural language understanding has been a major focus of research natural language generation is a relatively new and increasingly active field of research This book presents an overview of the state of the art in natural language generation describing both new results and directions for new research The principal emphasis of natural language generation is not only to facilitate the use of computers but also to develop a computational theory of human language ability In doing so it is a tool for extending clarifying and verifying theories that have been put forth in linguistics psychology and sociology about how people communicate A natural language generator will typically have access to a large body of knowledge from which to select information to present to users as well as number of expressing it Generating a text can thus be seen as a problem of our ways decision making under multiple constraints constraints from the propositional knowledge at hand from the linguistic tools available from the communicative goals and intentions to be achieved from the audience the text is aimed at and from the situation and past discourse Researchers in generation try to identify the factors involved in this process and determine how best to represent the factors and their dependencies

Natural Language Processing for Global and Local Business

Pinarbasi, Fatih,Taskiran, M. Nurdan,2020-07-31 The concept of natural language processing has become one of the preferred methods to better understand consumers especially in recent years when digital technologies and research methods have developed exponentially It has become apparent that when responding to international consumers through multiple platforms and speaking in the same language in which the consumers express themselves companies are improving their standings within the public sphere Natural Language Processing for Global and Local Business provides research exploring the theoretical

and practical phenomenon of natural language processing through different languages and platforms in terms of today's conditions. Featuring coverage on a broad range of topics such as computational linguistics, information engineering, and translation technology, this book is ideally designed for IT specialists, academics, researchers, students, and business professionals seeking current research on improving and understanding the consumer experience.

Algebraic Structures in Natural Language Shalom Lappin, Jean-Philippe Bernardy, 2022-12-23

Algebraic Structures in Natural Language addresses a central problem in cognitive science concerning the learning procedures through which humans acquire and represent natural language. Until recently, algebraic systems have dominated the study of natural language in formal and computational linguistics, AI, and the psychology of language, with linguistic knowledge seen as encoded in formal grammars, model theories, proof theories, and other rule-driven devices. Recent work on deep learning has produced an increasingly powerful set of general learning mechanisms which do not apply rule-based algebraic models of representation. The success of deep learning in NLP has led some researchers to question the role of algebraic models in the study of human language acquisition and linguistic representation. Psychologists and cognitive scientists have also been exploring explanations of language evolution and language acquisition that rely on probabilistic methods, social interaction, and information theory rather than on formal models of grammar induction. This book addresses the learning procedures through which humans acquire natural language and the way in which they represent its properties. It brings together leading researchers from computational linguistics, psychology, behavioral science, and mathematical linguistics to consider the significance of non-algebraic methods for the study of natural language. The text represents a wide spectrum of views from the claim that algebraic systems are largely irrelevant to the contrary position that non-algebraic learning methods are engineering devices for efficiently identifying the patterns that underlying grammars and semantic models generate for natural language input. There are interesting and important perspectives that fall at intermediate points between these opposing approaches, and they may combine elements of both. It will appeal to researchers and advanced students in each of these fields as well as to anyone who wants to learn more about the relationship between computational models and natural language.

Building Natural Language Generation Systems Ehud Reiter, Robert Dale, 2000-01-28

Building Natural Language Generation Systems explains how to build Natural Language Generation (NLG) systems, computer software systems which use techniques from artificial intelligence and computational linguistics to automatically generate understandable texts in English or other human languages, either in isolation or as part of multimedia documents, Web pages, and speech output systems. Typically starting from some non-linguistic representation of information as input, NLG systems use knowledge about language and the application domain to automatically produce documents, reports, explanations, help messages, and other kinds of texts. The book covers the algorithms and representations needed to perform the core tasks of document planning, microplanning, and surface realization, using a case study to show how these components fit together. It also discusses engineering issues such as system

architecture requirements analysis and the integration of text generation into multimedia and speech output systems

Natural Language Processing: The PLNLP Approach Karen Jensen, George E. Heidorn, Stephen D. Richardson, 2013-02-26

Natural language is easy for people and hard for machines For two generations the tantalizing goal has been to get computers to handle human languages in ways that will be compelling and useful to people Obstacles are many and legendary Natural Language Processing The PLNLP Approach describes one group s decade of research in pursuit of that goal A very broad coverage NLP system including a programming language PLNLP development tools and analysis and synthesis components was developed and incorporated into a variety of well known practical applications ranging from text critiquing CRITIQUE to machine translation e g SHALT This books represents the first published collection of papers describing the system and how it has been used Twenty six authors from nine countries contributed to this volume Natural language analysis in the PLNLP approach is done in six stages that move smoothly from syntax through semantics into discourse The initial syntactic sketch is provided by an Augmented Phrase Structure Grammar APSG that uses exclusively binary rules and aims to produce some reasonable analysis for any input string Its approximate analysis passes to the reassignment component which takes the default syntactic attachments and adjusts them using semantic information obtained by parsing definitions and example sentences from machine readable dictionaries This technique is an example of one facet of the PLNLP approach the use of natural language itself as a knowledge representation language an innovation that permits a wide variety of online text materials to be exploited as sources of semantic information The next stage computes the intrasentential argument structure and resolves all references both NP and VP anaphora that can be treated at this point in the processing Subsequently additional components currently not so well developed as the earlier ones handle the further disambiguation of word senses the normalization of paraphrases and the construction of a paragraph discourse model by joining sentential semantic graphs Natural Language Processing The PLNLP Approach acquaints the reader with the theory and application of a working real world domain free NLP system and attempts to bridge the gap between computational and theoretical models of linguistic structure It provides a valuable
