Long-Term Climate Monitoring by the Global Climate Observing System Thomas R. Karl, 2012-12-06 Is the climate warming Is the hydrological cycle intensifying Is the climate becoming more variable or extreme Is the chemical composition of the atmosphere changing Is the solar irradiance constant Answers to these questions are fundamental to understanding predicting and assessing climate on time scales ranging from weeks to a century Atmospheric oceanic and environmental scientists have primarily relied on an ad hoc collection of disparate environmental observational and data management systems to address these problems But these systems were not designed to measure climate variations and as a result changes and variations of the earth system during the instrumental climate record is far from unequivocal This book develops a framework from which a Global Climate Observing System currently being discussed in international forums can be implemented to monitor changes and variations of climate Audience Administrators policy makers professionals graduate students and others interested in learning how we can ensure a long term climate record for application to national economic development and understanding ecosystem dynamics

Forecasting Peter Michael Inness, Steve Dorling, 2012-12-06 This book offers a complete primer covering the end to end process of forecast production and bringing together a description of all the relevant aspects together in a single volume with plenty of explanation of some of the more complex issues and examples of current state of the art practices Operational Weather Forecasting covers the whole process of forecast production from understanding the nature of the forecasting problem gathering the observational data with which to initialise and verify forecasts designing and building a model or models to advance those initial conditions forwards in time and then interpreting the model output and putting it into a form which is relevant to customers of weather forecasts Included is the generation of forecasts on the monthly to seasonal timescales often excluded in text books despite this type of forecasting having been undertaken for several years This is a rapidly developing field with a lot of variations in practices between different forecasting centres Thus the authors have tried to be as generic as possible when describing aspects of numerical model design and formulation Despite the reliance on NWP the human forecaster still has a big part to play in producing weather forecasts and this is described along with the issue of forecast verification how forecast centres measure their own performance and improve upon it Advanced undergraduates and postgraduate students will use this book to understand how the theory comes together in the day to day applications of weather forecast production In addition professional weather forecasting practitioners professional users of weather forecasts and trainers will all find this new member of the RMetS Advancing Weather and Climate series a valuable tool Provides an end to end description of the weather forecasting process Clearly structured and pitched at an accessible level the book discusses the practical choices that operational forecasting centres have to make in terms of what numerical models they use and when they are run Takes a very practical approach using real life case studies to contextualize information Discusses the latest advances in the area including ensemble methods monthly to seasonal range prediction and use of nowcasting tools such as radar and satellite imagery Full colour throughout Written by a highly respected team of authors with experience in both academia and practice Part of the RMetS book series Advancing Weather and Climate **NOAA's FY 2002 Budget** United States.
