Reevaluation Of The State Of The Science For Waterquality Criteria Development:

Developing Ambient Water Quality Criteria for Mercury D. R. J. Moore, A. Pawlisz, R. S. Teed, 2003-07-31 This project examined the development of ambient water quality criteria AWQC for the protection of wildlife for mercury. Mercury is considered a serious risk to wildlife in many areas. As a result the Great Lakes Water Quality Initiative and others have developed AWQC. These AWQC have been controversial however because 1 the AWQC were single values that did not account for site specific conditions 2 derivation of the AWQC relied on a single NOAEL and 3 the AWQC had an unknown level of conservatism because of reliance on both average and conservative assumptions and uncertainty factors. Rather than develop a single value AWQC for total mercury we derive an AWQC model that explicitly incorporates factors controlling bioavailability, methylation rates and bioaccumulation in the aquatic environment e.g. pH, DOC, sulfate. To derive our AWQC model field data was collected including numerous water quality parameters and total mercury and methylmercury concentrations in whole body fish tissue from 31 lakes in Ontario and an additional 10 lakes in Nova Scotia. An independent dataset consisting of 51 water bodies in the United States was then used to confirm the validity and robustness of the AWQC model. Next we combined the results of chronic feeding studies with similar protocols and endpoints in a meta analysis to derive a dose response curve for mink exposed to mercury in the diet. Using this approach one can derive an LD5 or other similar endpoint that can then be used as the basis for deriving wildlife AWQC. In the final step we used a probabilistic risk model to estimate the concentrations of methylmercury in water that would lead to levels in fish sufficient for there to be a 10% probability of exceeding the mink LD5. This analysis was repeated for various combinations of pH and DOC. The result is an AWQC model for mercury for the protection of wildlife that can be used for a variety of site specific conditions. Freshwater Bivalve Ecotoxicology Jerry L. Farris, John H. Van Hassel, 2006-11-16 Responding to the growing need for an aggressive yet conservative approach to evaluating mussel populations *Freshwater Bivalve Ecotoxicology* provides a collective review of the techniques and approaches for assessing contaminant impact on freshwater ecosystems The editors incorporate coverage of research topics and management issues from a cross section of scientists in the field They explore current advances in general monitoring of population responses to stressors fundamental concepts of ecotoxicology specific to burrowing bivalves and useful insights that offer direction and priority for resolving specific problems challenging protection and conservation efforts This book lays the groundwork with discussions of topics such as impact assessment

toxicokinetics biomarkers and pollution tolerance The authors then explore fundamental concepts surrounding responses measured in freshwater bivalves as a consequence of chemical exposures or accumulated contaminants in target organs or tissues They highlight the difficulties encountered with the laboratory culture of these organisms for toxicity testing or other controlled experiments and examine the use of surrogate test organisms to relate sensitivities of response and reduce pressure on already impacted fauna The book also reviews innovative field research using in situ bivalve toxicity testing discusses effects oriented tissue contaminant assessment and concludes with threefour specific laboratory or combined field laboratory ecotoxicology studies A summary of methods from more than 75 laboratory toxicity studies conducted with freshwater mussels the book provides an overview of a standardized method for conducting water only acute and chronic laboratory toxicity tests with glochidia juvenile freshwater mussels It focuses on studies that report measured contaminant treatments had robust experimental designs including replication of control and contaminant treatments and were published in the peer reviewed literature The resulting array of viewpoints provides a framework that can be used to establish priorities in the rehabilitation and management of freshwater ecosystems
