Mathematical Results in Quantum Mechanics Jaroslav Dittrich, Pavel Exner, Milos Tater, 2012-12-06 At the

age of almost three quarters of a century quantum mechanics is by all accounts a mature theory There were times when it seemed that it had borne its best fruit already and would give way to investigation of deeper levels of matter Today this sounds like rash thinking Modern experimental techniques have led to discoveries of numerous new quantum effects in solid state optics and elsewhere Quantum mechanics is thus gradually becoming a basis for many branches of applied physics in this way entering our everyday life While the dynamic laws of quantum mechanics are well known a proper theoretical understanding requires methods which would allow us to derive the abundance of observed quantum effects from the first principles In many cases the rich structure hidden in the Schrödinger equation can be revealed only using sophisticated tools This constitutes a motivation to investigate rigorous methods which yield mathematically well founded properties of quantum systems

A Glimpse at Hilbert Space Operators Sheldon Axler, Peter Rosenthal, Donald Sarason, 2011-04-13 Paul Richard Halmos who lived a life of unbounded devotion to mathematics and to the mathematical community died at the age of 90 on October 2 2006 This volume is a memorial to Paul by operator theorists he inspired Paul's initial research beginning with his 1938 Ph D thesis at the University of Illinois under Joseph Doob was in probability ergodic theory and measure theory A shift occurred in the 1950s when Paul's interest in foundations led him to invent a subject he termed algebraic logic resulting in a succession of papers on that subject appearing between 1954 and 1961 and the book Algebraic Logic published in 1962 Paul's first two papers in pure operator theory appeared in 1950 After 1960 Paul's research focused on Hilbert space operators a

subject he viewed as encompassing finite dimensional linear algebra. Beyond his research, Paul contributed to mathematics and to its community in manifold ways as a renowned expositor, as an innovative teacher, as a tireless editor, and through unstinting service to the American Mathematical Society and to the Mathematical Association of America. Much of Paul's influence owed at a personal level to Paul's genuine, uncalculating interest in people; he developed an enormous number of friendships over the years, both with mathematicians and with non-mathematicians. Many of his mathematical friends, including the editors of this volume, while absorbing abundant quantities of mathematics at Paul's knee, learned from his advice and his example what it means to be a mathematician.

Orthogonal Systems and Convolution Operators Robert Ellis, Israel Gohberg, 2003. The main concern of this book is the distribution of zeros of polynomials that are orthogonal on the unit circle with respect to an indefinite weighted scalar or inner product. The first theorem of this type proved by M. G. Krein was a far-reaching generalization of G. Szegő's result for the positive definite case. A continuous analogue of that theorem was proved by Krein and H. Langer. These results, as well as many generalizations and extensions, are thoroughly treated in this book. A unifying theme is the general problem of orthogonalization with invertible squares in modules over C^* -algebras. Particular modules that are considered in detail include modules of matrices, matrix polynomials, matrix valued functions, linear operators, and others. One of the central features of this book is the interplay between orthogonal polynomials and their generalizations on the one hand, and operator theory, especially the theory of Toeplitz matrices and operators, Fredholm and Wiener-Hopf operators, on the other hand. The book is of interest to both engineers and specialists in analysis.

Matrix and Operator Valued Functions I. Gohberg, L. A. Sakhnovich, 2012-12-06. This book is dedicated to the memory of an outstanding mathematician and personality Vladimir Petrovich Potapov, who made important contributions to and exerted considerable influence in the areas of operator theory, complex analysis, and their points of juncture. The book commences with insightful biographical material and then presents a collection of papers on different aspects of operator theory and complex analysis, covering those recent achievements of the Odessa-Kharkov school in which Potapov was very active. The papers deal with interrelated problems and methods. The main topics are the multiplicative structure of contractive matrix and operator functions, operators in spaces with indefinite scalar products, inverse problems for systems of differential equations, interpolation and approximation problems for operator and matrix functions. The book will appeal to a wide group of mathematicians and engineers, and much of the material can be used for advanced courses and seminars.

Picard, Sascha Trostorff, Marcus Waurick, 2020-08-24 This book presents a concise introduction to a unified Hilbert space

approach to the mathematical modelling of physical phenomena which has been developed over recent years by Picard and his co workers The main focus is on time dependent partial differential equations with a particular structure in the Hilbert space setting that ensures well posedness and causality two essential properties of any reasonable model in mathematical physics or engineering However the application of the theory to other types of equations is also demonstrated By means of illustrative examples from the straightforward to the more complex the authors show that many of the classical models in mathematical physics as well as more recent models of novel materials and interactions are covered or can be restructured to be covered by this unified Hilbert space approach The reader should require only a basic foundation in the theory of Hilbert spaces and operators therein For convenience however some of the more technical background requirements are covered in detail in two appendices The theory is kept as elementary as possible making the material suitable for a senior undergraduate or master s level course In addition researchers in a variety of fields whose work involves partial differential equations and applied operator theory will also greatly benefit from this approach to structuring their mathematical models in order that the general theory can be applied to ensure the essential properties of well posedness and causality

Topics in Interpolation Theory Bernd Fritzsche, Victor Katsnelson, Bernd Kirstein, 2012-12-06 About one half of the papers in this volume are based on lectures which were presented at a conference at Leipzig University in August 1994 which was dedicated to Vladimir Petrovich Potapov He would have been eighty years old These have been supplemented by 1 Historical material based on reminiscences of former colleagues students and associates of V P Potapov 2 Translations of a number of important papers which serve to clarify the Potapov approach to problems of interpolation and extension as well as a number of related problems and methods and are relatively unknown in the West 3 Two expository papers which have been especially written for this volume For purposes of discussion it is convenient to group the technical papers in this volume into six categories We will now run through them lightly first listing the major theme then in parentheses the authors of the relevant papers followed by discussion Some supplementary references are listed at the end OT72 which appears frequently in this volume refers to Volume 72 in the series Operator Theory Advances and Applications It was dedicated to V P Potapov 1 Multiplicative decompositions Yu P Ginzburg M S Livsic I V Mikhailova V I Smirnov

One-dimensional Functional Equations Genrich Belitskii, Vadim Tkachenko, 2012-12-06 The monograph is devoted to the study of functional equations with the transformed argument on the real line and on the unit circle Such equations systematically arise in dynamical systems differential equations probabilities singularities of smooth mappings and other areas The purpose of the book is to present modern methods and new results in the subject with an emphasis on a connection between local and global solvability The general concepts developed in the book are applicable to multidimensional functional equations Some of the methods are presented for the first time in the monograph literature The book is addressed to graduates and researchers interested in dynamical systems differential equations operator theory or the theory of functions and their applications

Series in Banach Spaces Vladimir Kadets, 2012-12-06 Series of scalars vectors or functions are among the fundamental objects of mathematical analysis When the arrangement of the terms is fixed investigating a series amounts to investigating the sequence of its partial sums In this case the theory of series is a part of the theory of sequences which deals with their convergence asymptotic behavior etc The specific character of the theory of series manifests itself when one considers rearrangements permutations of the terms of a series which brings combinatorial considerations into the problems studied The phenomenon that a numerical series can change its sum when the order of its terms is changed is one of the most impressive facts encountered in a university analysis course The present book is devoted precisely to this aspect of the theory of series whose terms are elements of Banach as well as other topological linear spaces The exposition focuses on two complementary problems The first is to characterize those series in a given space that remain convergent and have the same sum for any rearrangement of their terms such series are usually called unconditionally convergent The second problem is when a series converges only for certain rearrangements of its terms in other words converges conditionally to describe its sum range i e the set of sums of all its convergent rearrangements

Convolution Operators and Factorization of Almost Periodic Matrix Functions Albrecht Böttcher, Yuri I. Karlovich, Ilya M. Spitkovsky, 2012-12-06 Many problems of the engineering sciences physics and mathematics lead to convolution equations and their various modifications Convolution equations on a half line can be studied by having recourse to the methods and results of the theory of Toeplitz and Wiener Hopf operators Convolutions by integrable kernels have continuous symbols and the Cauchy singular integral operator is the most prominent example of a convolution operator with a piecewise continuous symbol The Fredholm theory of Toeplitz and Wiener Hopf operators with continuous and piecewise continuous matrix symbols is well presented in a series of classical and recent monographs Symbols beyond piecewise continuous symbols have discontinuities of oscillating type Such symbols emerge very naturally For example difference operators are nothing but convolution operators with almost periodic symbols the operator defined by A
