Multi-Layer Potentials and Boundary Problems Irina Mitrea, Marius Mitrea, 2013-01-05 Many phenomena in engineering and mathematical physics can be modeled by means of boundary value problems for a certain elliptic differential operator in a given domain When the differential operator under discussion is of second order a variety of tools are available for dealing with such problems including boundary integral methods variational methods harmonic measure techniques and methods based on classical harmonic analysis When the differential operator is of higher order as is the case e g with anisotropic plate bending when one deals with a fourth order operator only a few options could be successfully implemented In the 1970s Alberto Calderón one of the founders of the modern theory of Singular Integral Operators advocated the use of layer potentials for the treatment of higher order elliptic boundary value problems The present monograph represents the first systematic treatment based on this approach This research monograph lays for the first time the mathematical foundation aimed at solving boundary value problems for higher order elliptic operators in non smooth domains using the layer potential method and addresses a comprehensive range of topics dealing with elliptic boundary value problems in non smooth domains including layer potentials jump relations non tangential maximal function estimates multi traces and extensions boundary value problems with data in Whitney Lebesgue spaces Whitney Besov spaces Whitney Sobolev based Lebesgue spaces Whitney Triebel Lizorkin spaces Whitney Sobolev based Hardy spaces Whitney BMO and Whitney VMO spaces

Abstract Parabolic Evolution Equations and their Applications Atsushi Yagi, 2009-11-03 This monograph is intended to present the fundamentals of the theory of abstract parabolic evolution equations and to show how to apply to various nonlinear diffusion equations and systems arising in science The theory gives us a unified and systematic treatment for concrete nonlinear diffusion models Three main approaches are known to the abstract parabolic evolution equations namely the semigroup methods the variational methods and the methods of using operational equations In order to keep the volume of the monograph in reasonable length we will focus on the semigroup methods For other two approaches see the related references in Bibliography The semigroup methods which go back to the invention of the analytic semigroups in the middle of the last century are characterized by precise formulas representing the solutions of the Cauchy problem for evolution equations The analytic semigroup generated by a linear operator A provides directly a fundamental solution to the Cauchy problem for an autonomous linear diffusion equation $u_t + Au = 0$

Partial Differential Equations in Anisotropic Musielak-Orlicz Spaces Iwona Chlebicka, Piotr Gwiazda, Agnieszka Świerczewska-Gwiazda, Aneta Wróblewska-Kamińska, 2021-11-01 This book provides a detailed study of nonlinear partial differential equations satisfying certain nonstandard growth conditions which simultaneously extend polynomial inhomogeneous and fully anisotropic growth The common property of the many different kinds of equations considered is that the growth conditions of the highest order operators lead to a formulation of the equations in Musielak Orlicz spaces This high level of generality understood as full anisotropy and inhomogeneity requires new proof concepts and a generalization of the formalism calling for an extended functional analytic framework This theory is established in the first part of the book which serves as an introduction to the subject but is also an important ingredient of the whole story The second part uses these theoretical tools for various types of PDEs including abstract and parabolic equations but also PDEs arising from fluid and solid mechanics For connoisseurs there is a short chapter on homogenization of elliptic PDEs The book will be of interest to researchers working in PDEs and in functional analysis

Vector Extrapolation Methods with Applications Avram Sidi, 2017-09-26 An important problem that arises in different disciplines of science and engineering is that of computing limits of sequences of vectors of very large dimension Such sequences arise for example in the numerical solution of systems of linear and nonlinear equations by fixed point iterative methods and their limits are simply the required solutions to these systems The convergence of these sequences which is very slow in many cases can be accelerated

successfully by using suitable vector extrapolation methods Vector Extrapolation Methods with Applications is the first book fully dedicated to the subject of vector extrapolation methods It is a self contained up to date and state of the art reference on the theory and practice of the most useful methods It covers all aspects of the subject including development of the methods their convergence study numerically stable algorithms for their implementation and their various applications It also provides complete proofs in most places As an interesting application the author shows how these methods give rise to rational approximation procedures for vector valued functions in the complex plane a subject of importance in model reduction problems among others This book is intended for numerical analysts applied mathematicians and computational scientists and engineers in fields such as computational fluid dynamics structures and mechanical and electrical engineering to name a few Since it provides complete proofs in most places it can also serve as a textbook in courses on acceleration of convergence of iterative vector processes for example
