Abstract: Intelligent energy management in renewable-based power distribution applications, such as microgrids, smart grids, smart buildings, and EV systems, is becoming increasingly important in the context of the transition toward the decentralization, digitalization, and decarbonization of energy networks. Arguably, many challenges can be overcome, and benefits leveraged, in this transition by the adoption of intelligent autonomous computer-based decision-making through the introduction of smart technologies, specifically artificial intelligence. Unlike other numerical or soft computing optimization methods, the control based on artificial intelligence allows the decentralized power units to collaborate in making the best decision of fulfilling the administrator's needs, rather than only a primitive decentralization based only on the division of tasks. Amongst the smart approaches, reinforcement learning stands as the most relevant and successful, particularly in power distribution management applications. The reason is it does not need an accurate model for attaining an optimized solution regarding the interaction with the environment. Accordingly, there is an ongoing need to accomplish a clear, up-to-date, vision of the development level, especially with the lack of recent comprehensive detailed reviews of this vitally important research field. Therefore, this paper fulfills the need and presents a comprehensive review of the state-of-the-art successful and distinguished intelligent control strategies-based RL in optimizing the management of power flow and distribution. Wherein extensive importance is given to the classification of the literature on emerging strategies, the proposals based on RL multiagent, and the multiagent primary secondary control of managing power flow in micro and smart grids, particularly the energy storage. As a result, 126 of the most relevant, recent, and non-incremental have been reviewed and put into relevant categories. Furthermore, salient features have been identified of the major positive and negative, of each selection.

Keywords: microgrid; smart grid; multiagent; artificial intelligence; decentralization; autonomy; renewable energy

1. Introduction

The control of renewable energy in modern power distribution applications, such as microgrids, smart grids, smart buildings, and electric vehicles (EVs) applications, is experiencing a large, fundamental transition due to several technological advances and environmental considerations. For instance, the world is gearing toward the enhancement of the introduction of renewable energy and transportation based on either EVs or alternative fuels, due to their economic, technical, and environmental advantages [1]. However, the current global electricity and alternative fuel generation is still a mixed fuel, with the supremacy of fossil fuel remaining in many regions of the world. In fact, both trends are fundamentally related since the use of renewable energy in charging EVs or generating alternative fuels such as hydrogen would significantly reduce greenhouse gas emissions [2]. Optimal power distribution control is the most prominent challenge in enhancing the penetration and sustainability of renewable energy and reducing the use of fossil fuels, due

Middle Range Theory and the Study of Organizations C.C. Pinder,L.F. Moore,2012-12-06 Late one afternoon in the fall of 1976 we were sipping Sanka and speculating on the possible directions towards which research and theory in organizational science might lead One of us had just re read Walter Nord s Marxist critique of Human Resource Management and the discussion evolved into an enumeration of the many articles that had appeared in the recent literature attacking the discipline its mission and its methods In no time the list was long enough to suggest that a number of scholars both young and established were dissatisfied with the rate of progress begin made in the

accumulation of knowledge about organizations The critics we identified were located at many different schools and they were associated with diverse research traditions and biases The causes they identified as underlying the problems they cited varied as did the solutions they offered We decided to pursue these polemics with a view to seeking commonalities among them hoping that if there were any dominant common themes it might be possible to anticipate the directions the field could take Our reading and thinking led us to the conclusion that many of the issues being raised by the critics of the discipline could be seen as disagreements over some implicit or ignored metaphysical and epistemological assumptions about organizations We hypothesized that much of the controversy resulted from a lack of consensus regarding what organizations are and how knowledge about them can be developed
