**Kinetic Models of Catalytic Reactions** G.S. Yablonskii,V.I. Bykov,V.I. Elokhin,A.N. Gorban,1991-04-17 This book has been written by a group of mathematicians and chemists whose common interest is in the complex dynamics of catalytic reactions Based on developments in mathematical chemistry a general theory is described that allows the investigation of the relationships between the kinetic characteristics of complex reactions and their detailed reaction mechanism Furthermore a comprehensive analysis is made of some typical mechanism of catalytic reactions in particular for the oxidation of carbon monoxide on platinum metals In fact the book presents three kinetics a detailed oriented to the elucidation of a detailed reaction mechanism according to its kinetic laws b applied with the aim of obtaining kinetic relationships for the further design of chemical reactors and c mathematical kinetics whose purpose is the analysis of mathematical models for heterogeneous catalytic reactions taking place under steady or unsteady state conditions

**Reaction Dynamics** I. Smith,2012-12-06 During the last 30 years our knowledge and understanding of molecular processes has followed the development of increasingly sophisticated techniques for studying fast reactions Although the results are reported in papers and reviews it is sometimes difficult for those not themselves active in these fields to find their way through the mass of published material We hope that each book in this series will present a clear account of the present state of knowledge in a particular field of physical chemistry to research workers in related fields to research students and for the preparation of undergraduate and post graduate lectures Each chapter describes the theoretical development of one area of study and the appropriate experimental techniques the results presented are chosen to illustrate the theory rather than to attempt a comprehensive review The first volume published in 1972 was concerned with the reactions of small molecules and free radicals in the gas phase The development of flash photolysis in the 1950s paved the way by making it possible to generate free radicals in sufficient concentration for a spectroscopic snapshot to reveal their molecular structure Their role in kinetic systems could then be followed directly rather than be inferred from mechanism The shock tube enabled gas mixtures to be heated to any desired temperature in a time which was shorter than subsequent chemical reactions
