Realistic Compiler Generation:

Realistic Compiler Generation Peter Lee, 1989 In this book Peter Lee provides a complete description and survey of the field of semantics based compiler generation and presents a new method for expressing the formal semantics of programming languages that allows realistic compilers to be generated automatically The method Lee describes has two main advantages over previous methods First it allows compilers to be generated automatically The compilers are realistic in the sense that they compile programs as efficiently as hand crafted compilers do and the object programs they produce run as efficiently as the object programs produced by hand crafted compilers The second advantage is that it makes it easier to comprehend and write the semantics than other methods The book demonstrates a working compiler generator called MESS which is used to generate a realistic compiler for a Pascal like language The generated compiler is then compared with several hand crafted compilers and shown to have at least comparable and in some cases superior performance Peter Lee is Assistant Professor of Computer Science at Carnegie Mellon University *Realistic Compiler Generation* is included in the series *Foundations of Computing* edited by Michael Garey and Albert Meyer

Partial Evaluation and Automatic Program Generation Neil D. Jones, Carsten K. Gomard, Peter Sestoft, 1993 Partial evaluation reconciles generality with efficiency by providing automatic specialization and optimization of programs This book covers the entire field of partial evaluation provides simple and complete algorithms and demonstrates that specialization can increase efficiency

Advanced Compiler Design Implementation Steven Muchnick, 1997-08 Computer professionals who need to understand advanced techniques for designing efficient compilers will need this book It provides complete coverage of advanced issues in the design of compilers with a major

emphasis on creating highly optimizing scalar compilers It includes interviews and printed documentation from designers and implementors of real world compilation systems Compiler Technology Derek Beng Kee Kiong,2012-12-06 Compiler technology is fundamental to computer science since it provides the means to implement many other tools It is interesting that in fact many tools have a compiler framework they accept input in a particular format perform some processing and present output in another format Such tools support the abstraction process and are crucial to productive systems development The focus of Compiler Technology Tools Translators and Language Implementation is to enable quick development of analysis tools Both lexical scanner and parser generator tools are provided as supplements to this book since a hands on approach to experimentation with a toy implementation aids in understanding abstract topics such as parse trees and parse conflicts Furthermore it is through hands on exercises that one discovers the particular intricacies of language implementation Compiler Technology Tools Translators and Language Implementation is suitable as a textbook for an undergraduate or graduate level course on compiler technology and as a reference for researchers and practitioners interested in compilers and language implementation **Semantics, Applications, and Implementation of Program Generation** Walid Taha,2003-06-30 This volume constitutes the proceedings of the second International Workshop on the Semantics Applications and Implementation of Program Generation SAIG 2001 held on 6 September 2001 in Florence Italy SAIG 2001 was held as an ACM SIGPLAN workshop co located with the International Conference on Principles Logics and Implementations of High level Programming Languages PLI As the commercial production of software systems moves toward being a traditional industry automation will necessarily play a more substantial role in this industry just as it plays a key role in the production of traditional commodities SAIG aims at promoting the development and the application of foundational techniques for supporting automatic program generation A key goal of SAIG is to provide a unique forum for both theoreticians and practitioners to present their results and ideas to an audience from a diverse background This year we are fortunate to have three in uential invited speakers Krzysztof Czarnecki DaimlerChrysler Tim Sheard OGI School of Science and Engineering and Mitchell Wand Northeastern University The proceedings include abstracts of the invited talks and an invited paper by Tim Sheard Seven technical papers and two position papers were presented at SAIG 2001 Modern Compiler Design Dick Grune,Kees van Reeuwijk,Henri E. Bal,Ceriel J.H. Jacobs,Koen Langendoen,2012-07-20 Modern Compiler Design makes the topic of compiler design more accessible by focusing on principles and techniques of wide application By carefully distinguishing between the essential material that has a high chance of being useful and the incidental material that will be of benefit only in exceptional cases much useful information was packed in this comprehensive volume The student who has finished this book can expect to understand the workings of and add to a language processor for each of the modern paradigms and be able to read the literature on how to proceed The first provides a firm basis the second potential for growth **Computing Handbook, Third Edition** Teofilo Gonzalez,Jorge

Diaz-Herrera, Allen Tucker, 2014-05-07 Computing Handbook Third Edition Computer Science and Software Engineering mirrors the modern taxonomy of computer science and software engineering as described by the Association for Computing Machinery ACM and the IEEE Computer Society IEEE CS Written by established leading experts and influential young researchers the first volume of this popular handbook examines the elements involved in designing and implementing software new areas in which computers are being used and ways to solve computing problems The book also explores our current understanding of software engineering and its effect on the practice of software development and the education of software professionals Like the second volume this first volume describes what occurs in research laboratories educational institutions and public and private organizations to advance the effective development and use of computers and computing in today's world Research level survey articles provide deep insights into the computing discipline enabling readers to understand the principles and practices that drive computing education research and development in the twenty first century

Circuit Complexity and Neural Networks Ian Parberry, 1994 Neural networks usually work adequately on small problems but can run into trouble when they are scaled up to problems involving large amounts of input data Circuit Complexity and Neural Networks addresses the important question of how well neural networks scale that is how fast the computation time and number of neurons grow as the problem size increases It surveys recent research in circuit complexity a robust branch of theoretical computer science and applies this work to a theoretical understanding of the problem of scalability Most research in neural networks focuses on learning yet it is important to understand the physical limitations of the network before the resources needed to solve a certain problem can be calculated One of the aims of this book is to compare the complexity of neural networks and the complexity of conventional computers looking at the computational ability and resources neurons and time that are a necessary part of the foundations of neural network learning Circuit Complexity and Neural Networks contains a significant amount of background material on conventional complexity theory that will enable neural network scientists to learn about how complexity theory applies to their discipline and allow complexity theorists to see how their discipline applies to neural networks

Computability and

Complexity Neil D. Jones, 1997 Computability and complexity theory should be of central concern to practitioners as well as theorists Unfortunately however the field is known for its impenetrability Neil Jones's goal as an educator and author is to build a bridge between computability and complexity theory and other areas of computer science especially programming In a shift away from the Turing machine and Gödel number oriented classical approaches Jones uses concepts familiar from programming languages to make computability and complexity more accessible to computer scientists and more applicable to practical programming problems According to Jones the fields of computability and complexity theory as well as programming languages and semantics have a great deal to offer each other Computability and complexity theory have a breadth depth and generality not often seen in programming languages The programming language community meanwhile has a firm grasp of algorithm design presentation and implementation In addition programming languages sometimes provide computational models that are more realistic in certain crucial aspects than traditional models New results in the book include a proof that constant time factors do matter for its programming oriented model of computation In contrast Turing machines have a counterintuitive constant speedup property that almost any program can be made to run faster by any amount Its proof involves techniques irrelevant to practice Further results include simple characterizations in programming terms of the central complexity classes PTIME and LOGSPACE and a new approach to complete problems for NLOGSPACE PTIME NPTIME and PSPACE uniformly based on Boolean programs Foundations of Computing series

Dynamic Logic David Harel, Dexter Kozen, Jerzy Tiuryn, 2000-09-29 This book provides the first comprehensive introduction to Dynamic Logic Among the many approaches to formal reasoning about programs Dynamic Logic enjoys the singular advantage of being strongly related to classical logic Its variants constitute natural generalizations and extensions of classical formalisms For example Propositional Dynamic Logic PDL can be described as a blend of three complementary classical ingredients propositional calculus modal logic and the algebra of regular events In First Order Dynamic Logic DL the propositional calculus is replaced by classical first order predicate calculus Dynamic Logic is a system of remarkable unity that is theoretically rich as well as of practical value It can be used for formalizing correctness specifications and proving rigorously that those specifications are met by a particular program Other uses include determining the equivalence of programs comparing the expressive power of various programming constructs and synthesizing programs from specifications This book provides the first comprehensive introduction to Dynamic Logic It is divided into three parts The first part reviews the appropriate fundamental concepts of logic and computability theory and can stand alone as an introduction to these topics The second part discusses PDL and its variants and the third part discusses DL and its variants Examples are provided throughout and exercises and a short historical section are included at the end of each chapter

Semantics of Programming Languages Carl A. Gunter, 1992 Semantics of Programming Languages exposes the basic motivations and philosophy underlying the applications of semantic techniques in computer science It introduces the mathematical theory of

programming languages with an emphasis on higher order functions and type systems Designed as a text for upper level and graduate level students the mathematically sophisticated approach will also prove useful to professionals who want an easily referenced description of fundamental results and calculi Basic connections between computational behavior denotational semantics and the equational logic of functional programs are thoroughly and rigorously developed Topics covered include models of types operational semantics category theory domain theory fixed point denotational semantics full abstraction and other semantic correspondence criteria types and evaluation type checking and inference parametric polymorphism and subtyping All topics are treated clearly and in depth with complete proofs for the major results and numerous exercises

The Essence of Computation Torben Mogensen, David Schmidt, I. Hal Sudborough, 2003-07-01 By presenting state of the art aspects of the theory of computation this book commemorates the 60th birthday of Neil D Jones whose scientific career parallels the evolution of computation theory itself The 20 reviewed research papers presented together with a brief survey of the work of Neil D Jones were written by scientists who have worked with him in the roles of student colleague and in one case mentor In accordance with the Festschrift s subtitle the papers are organized in parts on computational complexity program analysis and program transformation

Domain-Specific Program Generation Christian Lengauer, 2004-05-24 Program generation holds the promise of helping to bridge the gap between application level problem solutions and efficient implementations at the level of today s source programs as written in C or Java Thus program generation can substantially contribute to reducing production cost and time to market in future software production while improving the quality and stability of the product This book is about domain specific program generation it is the outcome of a Dagstuhl seminar on the topic held in March 2003 After an introductory preface by the volume editors the 18 carefully reviewed revised full papers presented are organized into topical sections on surveys of domain specific programming technologies domain specific programming languages tool support for program generation domain specific techniques for program optimization

be read in any order and each volume contains a table of contents and subject index offering easy access to specific topics. The first volume of this popular handbook mirrors the modern taxonomy of computer science and software engineering as described by the Association for Computing Machinery (ACM) and the IEEE Computer Society (IEEE CS). Written by established leading experts and influential young researchers, it examines the elements involved in designing and implementing software, new areas in which computers are being used, and ways to solve computing problems. The book also explores our current understanding of software engineering and its effect on the practice of software development and the education of software professionals. The second volume of this popular handbook demonstrates the richness and breadth of the IS and IT disciplines. The book explores their close links to the practice of using, managing, and developing IT-based solutions to advance the goals of modern organizational environments. Established leading experts and influential young researchers present introductions to the current status and future directions of research and give in-depth perspectives on the contributions of academic research to the practice of IS and IT development, use, and management.

Methods and Tools for Compiler Construction B. Lorho, 1984. For a long time, compiler construction was considered an operation to be carried out by only a few skilled specialists. However, over the past decade, numerous theoretical advances have led to a methodology of compiler writing as well as to tools for automatic and semi-automatic compiler construction. This book is the result of an advanced course sponsored by the Commission of the European Communities and the Institut National de Recherche en Informatique et en Automatique. The course *Methods and Tools for Compiler Construction* was held in Rocquencourt in December 1983. The volume places its emphasis on specific areas where significant improvements have been made, including attribute grammars, compilation from semantic definitions, code generation and optimization, and Ada compiling.

Compiler Construction Alan Mycroft, 2006-03-21. This book constitutes the refereed proceedings of the 15th International Conference on Compiler Construction (CC 2006) held in March 2006 as part of ETAPS. The 17 revised full papers presented together with three tool demonstration papers and one invited paper were carefully reviewed and selected from 71 submissions. The papers are organized in topical sections.
