Recent Advances in Alzheimer Research Ahmad Salehi,Michael Rafii ,Cristy Phillips,2015-11-11

Recent Advances in Alzheimer Disease Research is a book series focusing on contemporary research on Alzheimer's disease epidemiology pathophysiology diagnosis and therapy The series features reviews by experts in neuroscience and aims to provide current information in the field to both

researchers and clinicians Down syndrome is a chromosomal disorder affecting more than 5 8 million individuals worldwide Down syndrome can be viewed as a complex multi system disorder as it manifests into significant physical psychological and cognitive abnormalities in affected persons With aging most adults with Down syndrome develop the clinical and neuropathological hallmarks of Alzheimer's disease Unfortunately no extant treatments have proven beneficial for cognitive dysfunction for either Down syndrome or Alzheimer's disease An incomplete understanding of the common pathogenic mechanisms that link these two disorders has limited researchers progress to this end Common Pathogenic Mechanisms between Down syndrome and Alzheimer's Disease Steps toward Therapy is a novel attempt to fill this void by summarizing the work of world renowned scientists in the field of Alzheimer's disease and Down syndrome and thus providing an

unprecedented opportunity to attract attention to Down syndrome as a tool for understanding the common molecular mechanisms that underlie Alzheimer's disease and to develop new therapies for similar neurodegenerative disorders of the brain The book covers the fundamental pathophysiology and molecular mechanisms behind the incidence of Alzheimer's disease in Down syndrome affected individuals as well other key topics such as diagnosis and management in vivo brain imaging studies and progressive neurodegeneration of the monoaminergic system The book concludes with a review of recent clinical trials of drugs designed to mitigate cognitive dysfunction in aging adults with Down syndrome and establishes a scientific warrant for the increased testing of candidate pharmacotherapies Common Pathogenic Mechanisms between

Down syndrome and Alzheimer's Disease Steps toward Therapy is a useful reference for clinicians involved in treating Down syndrome patients as well as for neuroscience researchers seeking to understand the influence of a specific case of

aneuploidy on Alzheimer's disease incidence and its progression at the molecular level *Recent advances in the treatment of epilepsy* Khojasteh Malekmohammad,Mahmoud Rafieian-Kopaei,Antonella Riva,2024-07-22 Epilepsy is one of the most common neurological chronic disorders characterized by unpredictable recurrent seizures which leads to brain dysfunction cognitive psychological and social disorders Various treatment options for epilepsy are antiepileptic drugs surgery neuromodulation gene therapy and ketogenic diet However definitions diagnosis and treatment of epilepsy are still challenging issues for clinicians and researchers Antiepileptic drugs play a central and crucial role in the treatment of epilepsy patients Brivaracetam Cannabidiol CBD Cenobamate Everolimus and Fenfluramine are the five novel anticonvulsant drugs during the last 5 years Brivaracetam anticonvulsant effects are due to its highly selective affinity for synaptic vesicle protein 2A SV2A in the brain It acts as an SV2A ligand Among these drugs Cannabidiol is one of the prominent phytocannabinoids derived from the cannabis sativa The anticonvulsant mechanisms of action of CBD including antagonism of G protein coupled receptor 55 GPR55 desensitization of transient receptor potential vanilloid type 1 TRPV1 channels and potentiation of adenosine mediated signaling through inhibition of the equilibrative nucleoside transporter 1 ENT 1 and enhancement of GABAergic transmission The mechanisms of the antiseizure effect of Cenobamate are increasing the inactivated state of voltage gated sodium channels and acting as a positive allosteric modulator of the GABA A receptors by binding at a non benzodiazepine site Everolimus is a mammalian target of rapamycin mTOR inhibitor Fenfluramine is able to enhance extracellular serotonin levels modulate serotonergic and other neurologic receptors Nevertheless the exact mechanism of action of most of these drugs is unknown At least 30% of people with epilepsy have drug resistant epilepsy DRE therefore non pharmacological treatments have been considered the Vagus Nerve Stimulation VNS Trigeminal Nerve Stimulation TNS Transcranial Direct Current Stimulation tDCS Transcranial Magnetic Stimulation TMS are the most common neuromodulation based approaches Also in recent years a new field of GABA adenosine galanin and neuropeptide Y based cell and gene therapies for refractory epilepsy has emerged In spite of these advances significant gaps in knowledge still remain In particular the mechanisms underlying epilepsy including status epilepticus drug and surgical treatments are still not well elucidated Novel insights on pathophysiological mechanisms of epilepsy and new treatment options prompted us to collect the most recent publications on pharmacological and non pharmacological treatments of epilepsy So in this Research Topic we will focus on the advances in the field of treatment in epilepsy the pathophysiology and molecular aspects of seizure attacks and novel antiseizure medications **Recent Advances in Zebrafish Researches** Yusuf Bozkurt,2018-05-30 Model organisms have been used in various disciplines in order to understand different mechanisms underlying the problems From this point of view the zebrafish has become a favorite model organism in different scientific research fields in recent years because of its rapid embryonic development transparency of its embryos and its large number of offspring along with several other advantages Recent Advances in Zebrafish Researches demonstrates the role and the
