**Power Estimation and Optimization Methodologies for VLIW-based Embedded Systems** Vittorio Zaccaria, M.G. Sami, Donatella Sciuto, Cristina Silvano, 2007-05-08 LOW power design is playing an important role in today ultra large scale integration ULSI design particularly as we continue to double the number of transistors on a die every two

years and increase the frequency of operation at fairly the same rate. Certainly an important aspect of low power faces with mobile communications and it has a huge impact on our lives as we are at the start line of the proliferation of mobile PDA's, Personal Digital Assistants, Wireless LAN and portable multi media computing. All of these devices are shaping the way we will be interacting with our family, peers and workplace, thus requiring also a new and innovative low power design paradigm. Furthermore, low power design techniques are becoming paramount in high performance desktop, base station and server applications such as high speed microprocessors where excess in power dissipation can lead to a number of cooling, reliability and signal integrity concerns severely burdening the total industrial cost. Hence low power design can be easily anticipated to further come into prominence as we move to next generation System on Chip and Network on Chip designs. This book is entirely devoted to disseminate the results of a long term research program between Politecnico di Milano, Italy and STMicroelectronics in the field of architectural exploration and optimization techniques to designing low power embedded systems.
